This has not peen posted in a while (sorry) and there seems to have been
a few recent questions that this might help with. I hope someone finds
it useful:

An Amateur Packet Radio Overview

by

Rich Bono (NM1D)

October, 1990
(revision 1.2)

The following is the result of a non-amateur asking some basic questions about amateur packet radio. Several of us thought that this information would be useful to others who are interested in amateur packet operations. Thanks to Tim Dayger for asking the right questions, and to Patty Winter

(N6BIS) for her editing skills. I hope that this will be of help to many others. You may reproduce and distribute this as long as my credits remain.

Rich Bono (NM1D)

Our potential amateur packet radio operator asks:
I've used networks, on-line services, and bulletin board systems (BBS) for years, but I've never really paid much attention to amateur packet radio. I'm starting from scratch, and need to have some idea of where to begin.

Just what IS amateur packet radio?

Amateur packet radio is (yet another) digital transmission method available for use via amateur radio. It provides 'error free' transmission and reception of messages (information/data/etc.) between two stations. This error-free capability is a prime consideration. Error free in this context does not mean that your typing or spelling mistakes will be fixed, but that all transmitted 'data' will be received 100% intact, as sent. In fact, if the data cannot be delivered 100% intact, the transmission is eventually aborted and the user is informed that there is no longer a connection between the two stations.

The 'packet' in 'packet radio' comes from the method of transmitting your information over the air. Your data is broken up into packets (or blocks) that are transmitted. Each packet contains the sending and the receiving station call-signs and some optional routing information. A packet can contain from 0 to 256 data (or information) bytes. The users normally do not need to be concerned with this 'packetizing' of their messages. Each packet is sent and then acknowledged by the receiver when received. If a packet is not received correctly, then it is automatically re-transmitted (up to a maximum number of times). You normally don't have to know about all this to use packet radio. The 'packetizing' happens automatically, without any thought or actions required by you.

One of the more popular protocols used for amateur packet radio is known as AX.25. This is somewhat similar to the commercial X.25 standard. There is also a growing TCP/IP user base. If you are not network oriented, then the details of these protocols are not important to you as an operator of a packet radio station.

Be aware that most packet radio operation at this time is at 1200 baud. This will seem slow when compared to what it happening on networks, and on telephone BBSs.... but what is gained is world-wide access, for NO COST. Once you have your equipment, and your license, there are no fees (except for the electricity that your computer and other equipment use). There are a growing number of amateurs who are experimenting with 2400 and even 9600 (or higher) baud operation, so it shouldn't be too long before these faster rates become very popular!

What kind of equipment do I need, and how do I use it with my PC?

Since you own a PC, you already own the most expensive part of an amateur packet radio station. The other piece of equipment that you need is the

TNC (terminal node controller). The TNC contains all the software and special hardware that you need. It actually contains the modem (to interface with your radio) and (usually) a microprocessor with the packet software contained in EPROM. You interface your PC (or even a simple dumb ASCII terminal) with the TNC via serial RS-232. Use your favorite terminal emulation software on your PC (the same software that you use with your telephone modem will probably work fine). This is just as easy as connecting your computer to a modem. If you don't want to use the serial port of your computer, there are TNCs available that will plug directly into the bus.

If you don't have a PC (personal computer), then almost any RS-232 ASCII terminal will work with most of todays TNCs.

The most popular packet frequencies in the USA are in the two-meter band (144-148 MHz). Check out the following frequencies (they may be different in your area; ask a local amateur if you don't hear anything). Even the typical 'police scanner' can be used to listen to these frequencies:

145.01, 145.03, 145.05, 145.07, 145.09 MHz

If the above are busy, many areas also use:
144.91, 144.93, 144.95, 144.97, 144.99 MHz

Yes, this is with an average FM transceiver set for SIMPLEX operation (transmitting and receiving on the same frequency).

If there are packet radio transmissions you should hear a sound like:

BBBBbbbbbrrrrraaaaaaapppppp

How much technical or hardware proficiency is required to use a packet radio system?

If you can plug an RS-232 cable into a modem, and wire the TNC to your radio, then you have all the ability that you need. I am sure that there are hams in your area who would be glad to help you if you are not comfortable with wiring a microphone connector. Most TNCs connect to the microphone plug of an FM transceiver, normally only needing push-to-talk and transmit audio connections, and a connection to the speaker audio output from the FM receiver. This consists of about five wires, and can usually be done without removing the covers of the radio (these are normally external connections).

Installation really is very simple, and once it is done, there is virtually no maintenance. Just plug in your TNC in place of your microphone and external speaker, and you're on the air... to return to voice operation, plug in your microphone. If you like, build a simple switch box to allow easy changing between your TNC and voice operation. I don't recommend it, but some people wire the TNC and microphone in parallel, so that they don't need to change the plugs, or switch anything at all.

What's out there for me to access via packet radio and what potential is

there for growth?

This is the interesting part! I believe that packet radio is still in its infancy. It seems like every day a new application for packet radio is announced... some are good ideas... others not. By the time you read this, a lot of the information presented here will probably be out of date; yes this technology is progressing!!!

Here is a *simple* list that barely highlights some of the available uses of amateur packet radio.. I am SURE that I have forgotten something and left it off the list:

EMAIL:
At this time we have world-wide email (electronic mail) distribution. I personally have received email from a few continents, and from all over the USA. Of course, this is limited by the amateur radio rules and regulations, so there cannot be any commercial messages.

Local networks:
Here in New England we have connectivity over most of the region. I can connect to other stations from the following areas consistently: Canada (Montreal), Vermont, New Hampshire, Maine, Connecticut, Massachusetts, Rhode Island and New York. I should note that I am located about 10 miles north of the MA/NH border (in Derry, NH).

Of course, on the HF (high frequency) bands there can be world-wide connectivity, depending on many factors.

PacketCluster-DX spotting:
This is a specialized system that allows a couple of hundred users to be connected to the same system at one time. It is used by those amateur operators who seek contacts with rare stations throughout the world. When any one user 'finds' a rare station on the air, he simply types the information (call-sign, frequency and mode) into his terminal, and within a minute or so, all of the other users are informed of the rare station!!! So-called "DXers" (people who like to hunt these rare stations) LOVE this system. These users can be spread over a wide area. Our local packet cluster system has connectees from Maine to New York.

DOSGATE:
A system that allows you to execute programs remotely. A DOSGATE system may have many programs for you to use over the air. You don't need to download the programs to use them; you are actually running programs remotely. DOSGATE allows those who don't have a computer to run programs via packet radio.

For example, my DOSGATE system has the following programs available for use by remote packet users:

AUTOEXAM: Take sample amateur exams from Novice to Extra. You can use AUTOEXAM as a study guide, or to see if you are ready for a certain license exam.

SeeSats: Real time satellite tracking. Informs you of where the current OSCAR (and other) satellites are located.

AUTOCALL: On-line amateur radio USA call-sign lookup database. Simply enter the call-sign of any amateur radio operator in the USA and it will print out the name, address, license class and previous call-sign (if any).

GAMES: Several adventure-style games that can be played on-line.

Repeater database: A database of many of the repeaters in the area.

Gateways:

Even though you may not own any HF or UHF equipment (many packet radio operators only use a simple hand-held VHF transceiver), you can gain access to other bands and operating modes by using a gateway. A gateway allows connectivity between two normally non-connectable communication technologies.

In many areas not only are there major BBSs on the standard two-meter Technician class frequencies and the 222 MHz Novice class sub-band, but there are cross-band gateways available as well. A Novice on the 222 MHz band can connect to a station on the 145 MHz band by going through a gateway and be able to communicate with many other amateurs.

Public Service:

Many packet stations are used to help out with sending messages during disasters. Amateur radio operators help out whenever they can, and many hams have their packet stations ready for portable operation to help when needed. There are many training exercises during each year to help practice and test the readiness of the emergency stations.

OSCAR Satellites:

OSCAR stands for Orbital Satellites Carrying Amateur Radio. We have our OWN satellites in orbit that are dedicated for amateur radio use. There are some satellites that are dedicated to packet radio (sometimes called "PACSATS"). These are for 'store-and-forward' operations to help distribute packet traffic around the world.

Bulletin boards:

These carry postings similar to the stuff on Usenet (or telephone BBSs) and often have archives of useful files (such as local ham license testing sites). These are usually the same packet nodes that transport email.

File transfers:
Better at 56 Kbaud (as some hams are doing), but feasible at 1200 baud. On TCP/IP, you just start it and forget it, so you can do it overnight or at some other time when you don't care whether it takes a while.

Databases:
In some areas there are HAZMAT (hazardous materials), call-sign, and repeater databases accessible via the network.

Station-Station:
I almost forgot.. many people simply enjoy chatting with their neighbors.... This could be with people across the street... or in the next state... or half-way around the world!

I am sure that I have missed something. You asked about potential... as I mentioned at the beginning, we are just getting started!!! Many people are just finding out about packet radio. I believe that the only limitation is our imagination!! We could have a world-wide network (we do currently have a 'slow-speed' world-wide network) in the near future... It just takes a little imagination...

How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?

Well, if you own the PC already... TNCs can be purchased from about $120.00 on up. There are a few for less money, and several that provide for operating on many digital modes in addition to packet radio (i.e., the Kantronix KAM will provide for packet (HF:300 baud/VHF:1200 baud), AMTOR, RTTY, ASCII, NAVTEX, WEFAX, CW (Morse code),...).

If you already own an amateur FM transceiver (or an HF SSB transceiver) then you have all the equipment needed. If not, a two-meter FM transceiver can be purchased for used from $100-250.00, new from $300.00 on up.

Cost effective.... Hmmm, well first be aware that amateur radio cannot be used for any commercial or business purposes... But where else can one get hours (years) of enjoyment and service out of $470.00 ($350 for a radio and $120 for a TNC, assuming you already have the computer or terminal). Note: This stuff can be contagious.... be forewarned!!

What legal issues do I need to consider regarding packet radio? Do I need a license?

Yes, you need a valid amateur radio license. There is (in the southern New Hampshire area) packet radio activity on the Novice bands. But if you want access to the mainstream of packet radio, you will want at least a Technician amateur radio license. (Although, as mentioned earlier, some areas have an active packet radio network that is accessible with the Novice amateur radio license.)

I've tried reading about amateur packet radio, but a lot of it is Greek to me. Please suggest some reading materials such as books and magazines that my campus or local libraries might carry.

  There are a few books, etc... but I have found that most assume that you already know about amateur radio. You need to find what we call (ready for another term?) an "Elmer". An "Elmer" is a friendly, helping amateur radio operator who will take you under his/her wing to help and guide you as much as you need. I hope that you can find someone to help you... it takes a special kind of person to be an 'Elmer' (gosh I hate that term).

  Good luck with your packet radio activities. If you find this information helpful, I would be glad to hear from you.... How? Simply send me a message via the amateur packet network, NM1D@NM1D.NH.USA.NOAM from anywhere in the world!

I have been watching this group for weeks and and surprised at the number of requests for FAQs that have not been answered by posting. Well, I did a Veronica search through gopher and have identified many gopher sites that have Packet Radio information (including various FAQs) available for us all.

I am happy to point anyone who is as ignorant and interested in Packet Radio as I am to these sources. I can forward or post this info if anyone does not have gopher access, too.

Can I ask the regular, long term readers of this group why a FAQ hasn't been posted in response to these requests? Is there a policy for this group which excludes posting of FAQs? Or is it simply that everyone assumes that someone else will do it? :-)

Thanks,

Tim

Does anyone have a description of the inter-BBS mail and
bulletin forwarding protocol ? I want to implement the
interface as seen by "normal" PBBS when they are forwarding
mail between each other. I think it is a subset of the
normal commands, but with machine style responses.

Thanks,

I don't yet have it but I have seen it. A small brown booklet
published by the ARRL that describes the protocols you (and I too)
want. Look in the published ARRL listings for this book. It includes
state diagrams of the transmission protocol and such.

Bob Proulx, kf0uw

I finally got my hamshack setup with TCP/IP on VHF, which is fun. I would
also like to do TCP/IP on HF, which would probably be even more fun.
What HF freqs are currently being used as the standard for HF TCP/IP?

If you are using DCD detect, that is alright. If you need to
mute the squelch in a non-DCD mode, that is not the way to
have it set up.

>What are the most common modems, cost, radios, bands, etc.....
>
>Is there 1 "standard" for 9600 baud transmissions, or are there many?

There is one primary "standard", the K9NG method. That interoperates
with the G3RUH design used by most of the manufacturers, including
PacComm and Kantronics. While not the ideal modulation method, it
works well enough.

>I am somewhat confused as to why a special radio is needed.

That's because the bandwidth required for the K9NG style modulation
is greater than what speech radios are designed to pass cleanly.
The modulation is sensitive to differential phase distortion. Thus
you need a radio with excellent flatness in it's IF passband response.

You want to insert and extract the modulation at the FM modulator and
FM discriminator to prevent "twist" introduced by pre-emphasis circuits
and to reduce bandwidth reductions caused by "tailored" audio circuitry
in the radio. Most voice grade radios can be made to work, but some
surgery may be required.

At the higher speed of 9600 baud, the TR turnaround delay of the
radio becomes a relatively large fraction of channel time with the fairly
short packet lengths used in amateur radio. It's worthwhile to get a
radio that switches really fast. I use a pair of Tekk Data radios I
got from Gracilis. The Kantronics Data radios are reported to work
fairly well, but I haven't used one yet.

>Are there 9600 baud modem kits?

TAPR used to sell the original K9NG modem, and Radio Kit had the
G3RUH. I don't know if either kit is still available. Complete
modems are available wired/tested from PacComm and Kantronics and
likely others. The PacComm unit costs $89, or at least it did
when I bought a pair.

Subject: RSGB GB2RS news for the 8th November
Distribution: world
Organization: 5/10
X-Mailer: Simple NEWS 1.90 (ka9q DIS 1.18)
Lines: 175
Date: Sat, 7 Nov 1992 08:06:48 +0000
Message-ID: <721140883snz@tedb.demon.co.uk>
Sender: usenet@gate.demon.co.uk

Good morning. It's Sunday the 8th of November and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- A change of publicised date for the next Novice RAE; some news for fans of VLF; and the IEE has a lecture in Bournemouth.

The Society have just being informed by City and Guilds of London Institute that the next Novice Radio Amateur's examination, subject 773 will take place on Monday the 14th of December and not the 7th as was previously notified to the RSGB.

Anyone interested in the use of radio at VLF, that is below 150kHz, may like to contact the Cave Radio and Electronics Group whose members use VLF to aid the exploration, surveying and scientific research of caves and pot-holes. The group publishes a quarterly journal which includes information on inductive communication, antenna design and modulation methods. The Cave Radio and Electronics Group can be contacted by writing to David Gibson at 12 Well House Drive, Leeds LS8 4BX, or phoning him on 0532 481218.

The Royal Grammar School in Guildford, Surrey, was one of those chosen to participate last year in Project JUNO. This involved them in an amateur radio contacts with astronaut Helen Sharman on the space station Mir. The school was recently privileged to receive a visit from Miss Sharman who gave an hour-long talk about her experiences in space.

Members of the RSGB should have received the November edition of Radio Communication and Annual Report by now. Please remember that Ballot papers for council nominations must be received at RSGB Headquarters by 12 noon on the 30th of November. If you have not received your November RadCom or the separate Annual Report please contact RSGB HQ as soon as possible.

The 2 metre Beacon GB3VHF at Wrotham, Kent was switched off on October 28th due to a malfunction and is expected to be off-air for a few weeks more.

The Institution of Electrical Engineers presents an illustrated lecture entitled 'Microsatellites' on Wednesday the 11th of November at 7.30 pm, to be held at the Highcliff Hotel, St Michaels Road, West Cliff, Bournemouth. The lecture will be given by Craig Underwood of the University of Surrey's Centre for Satellite Engineering Research. For further details contact Mr F Donachie, by telephoning 0202 404022.

On a lighter note, last Monday the 2nd of November, the wife of RSGB Council Member Neil Lasher, G6HIU, presented him with a baby girl.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Pacific, G4IUF will start his activity on Wednesday the 11th of November. From 30 minutes before, until 30 minutes after British Isles sunrise he will be on 3785 and 3505kHz, then 7075 and 7005kHz then 10105 kHz from each location. It would be advisable to check greyline paths from ZK2. From Canada, the special callsign VC350A will be aired from the 17th to the 30th November to commemorate the 50th Anniversary of the Listowel Squadron of the Royal Canadian Air Cadets. From Hawaii, AH6IO will activate the Kalaupapu Peninsula from Friday the 13th to Sunday the 15th of November. Operation on all bands from 160 through to 6 metres including the WARC bands. From Antarctica, W6REC will sign KC4AAF from McMurdo Base, from now until the 1st of February. On CW check the frequencies 3505, 7005, 14025, 21025 and 28025kHz, and for SSB the frequencies 7175 and 14180 to 14190kHz.

Rally news now, and we know of three rallies for today, Sunday the 8th of November:

There is the Barnsley Amateur Radio Rally being held at Willowgarth Senior High School, Brierley Road, Grimethorpe, Barnsley. It is located mid-way between Pontefract and Barnsley, just off the main A628 Barnsley to Pontefract Road. Doors open at 11.00am, 10.30 for disabled visitors, but please note that due to restoration work the rally will not be suitable for wheelchair users. There are the usual trade stands, plus over 20 radio clubs and specialised group's stands, and a large bring and buy stall. The event also offers catering facilities and parking on site. Talk-in will be on channel S22.

Next the MARS/Stockland Mobile Radio Rally which being held at the Stockland Green Leisure Centre, Slade Road, Erdington, Birmingham. There will be trade stands, a bring and buy stall and free car parking.

The Tyne and Wear Repeater Group Auction is being held at the Fencehouses Community Centre, Fencehouses, near Chester-le-Street, Co Durham. Doors open at 10.30am for booking in and the auction starts at 12 noon.

There is one event that we know of for next Sunday, the 15th:

This is Bridgend and District Amateur Radio Club Rally which is to be held at the Bridgend Recreation Centre, Bridgend, Mid Glamorgan. From the M4 motorway, use Junction 36. Doors open at 11.00am, or 10.30 for disabled visitors. There will be a bring and buy stall and refreshments. Further details can be obtained from GW3RVG, by telephoning 0656 860434.

HF Contest news next:

During next Saturday the 14th the RSGB Club Calls Contests ("CCC") takes place from 2000 to 2400 GMT on 1900 to 1990kHz only. Further details can be found in August's RadCom, on page 74. During next weekend three overseas contests are scheduled to run: There is the JARL International DX Phone Contest from 2300GMT on Friday the 13th, to 2300GMT on Sunday the 15th. The OK (Czechoslovakian) CW DX Contest runs from 1200GMT on Saturday the 14th to 1200GMT on Sunday 15th. And the Australian Ladies Amateur Radio Association Contest is from 0001 to 2359 on the Saturday the 14th. For further details on these overseas contests see November's RadCom, page 14.

Now the VHF Contest news:

Today, Sunday the 8th, the 144MHz RSGB CW 6 Hour Contest will run between 0800 to 1400GMT. The next RSGB's 432MHz Cumulative Contest takes place on Friday the 13th, between 2030 to 2300GMT. For further details on these events, see June RadCom page 65.

Special event station ON4UVW will be active next Tuesday and Wednesday, the 10th and 11th, to commemorate the end of the first world war.

And now the solar factual data:

A major lightning strike has seriously damaged the Slough ionosonde and antenna. The observatory will be out of action for at least 2 weeks while another ionosonde is installed and the antennas rebuilt. Meanwhile we will use the French observatory at Poitiers which is at North 46 degrees on the Greenwich Meridian. Levels are generally higher than Slough as it is about 380 miles farther south.

The period 26th of October to the 1st of November has seen considerable flare activity, there were 7 M flares and 1 X. The largest was an X1.7/2B on the 30th together with M4.5/2B on the 26th and an M3.2/2N on the 27th. A proton event reaching 2,700 particle flux units commenced on the 30th, with a small mag storm and ionospheric disturbance. An alert was issued on the 1st of November predicting further mag storms and proton events. Sun spot counts rose to 243 on the 28th, the highest number since last February, and meaned about the 170s. Solar flux levels rose with the flare activity and averaged 162 units, the highest level since last July. The geomagnetic activity has risen to sub storm level with Ap indices of 33 units on the 27th and 32 units on the 29th. The period averaged 20.7 units. The radio quality indices dropped from excellent on the 26th down to below normal by the 29th, with the Canberra and Fort Collins Boulder circuits being very poor, but most circuits were recovering by the 1st. The aa indices, as supplied by the British Geological Survey for the period 20th to 25th October, were very quiet. The daily averages only reached 13.6 nanoTeslas with some periods down to only 2 nanoTeslas. The meaned sun spot count for October was RI 88.3 with a maximum of 131 on the 28th and a minimum of 36 on the 13th. The smoothed count for April 1992 is 103.1 +/- 5.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon,

averaged 11.6MHz, but declined over the period from 12.2MHz down to 11.1MHz. It is estimated that these levels are about 1MHz higher than would have been reported by Slough. The darkness hour lows averaged 3.1MHz, about 500kHz higher than Slough.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 9.8MHz, and the darkness hour lows 3.3MHz. Solar cycle 22 showed the steepest sunspot rise of the past 13 cycles. This led to forecasts of a very high, or possibly the highest, peak. In fact this did not happen. The decline so far has been very rapid both in spots and solar flux levels. The minimum is forecast for mid 1996. However the recent considerable increase in activity may completely upset this.

And lastly the solar forecast:

This week, the active side of the sun will be coming into view, with solar flux levels about the 130s. However, the passage of coronal holes at the beginning of the week may increase geomagnetic levels to unsettled. Ionospheric MUFs during daylight should reach 30MHz, with the darkness hour lows being up to 18MHz.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S Q and G7 N Vr series, and Novice calls in the 20 A D and 21 B D series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Report on the Budapest Packet Radio Internet Extension Demonstration

October 6, 1992
Edwin Brownrigg
Open Access Solutions
and
Dewayne Hendricks
Tetherless Access, Ltd.
October 12, 1992

ABSTRACT

This paper describes a project recently undertaken in Budapest, Hungary. It discusses why and how terrestrial packet radio was demonstrated as a feasible technology for wirelessly extending the Internet. Details are provided regarding the interface between the wireless link and the Internet, and the link itself. Some conclusions are drawn regarding the feasibility and desirability of packet radio as a means of providing Metropolitan Area Networks and Wide Area Networks in Hungary and other Central European Countries.

Sponsorship

The United States Agricultural Library was the sponsor of the project under the direction of Pam Andre, Associate Director for Automation. The Library at North Carolina State University administered the project. Tetherless Access, Ltd. and Open Access Solutions were the contractors.

Goal:

The goal of the Budapest project was to demonstrate the

technical feasibility of using packet radio as an interface to the Internet, thus establishing the potential for low cost international connectivity for the Central European Agricultural Libraries.

Objectives:

1. To demonstrate the potential for sharing documents (both ASCII and bit-mapped images) electronically via the Internet.

2. To establish a packet radio link between a conference site and the Hungarian Academy of Science, an Internet site.

3. To connect the packet radio link to the Internet, thus establishing a packet radio Internet extension (PRIE).

Setting

The setting for the demonstration was Budapest, in particular a building in Buda and another building across the Danube River in Pest. The distance was approximately 10 km.

We obtained written permission in advance from the Hungarian government to use frequencies in the 433-450 band for the packet radios as well as for voice communication.

The Link

One end of the link was at one of the buildings of the Hungarian Academy of Science, an Internet node. The Academy building, although tall, is surrounded by other tall buildings. The other end of the link was a Conference Center, north of the Academy. It flanked by very tall trees on its south side and is around a bend of the Danube River from the Academy. The majority of the distance between the two points is open air over the river.

Even with the distance between the two points of the link, two watt radios, omnidirectional antennae, and the lack of a clear line of sight between the two sites, with persistence, we established a connection. The best signal was obtained by the placement of the antenna at the conference center as high as we could get it in an area that was not blocked by obstructions.

The Internet

Prior to the demonstration it was confirmed that we could interface to the Internet via an Ethernet network that was in place at the Academy. That required us to bring along a Kinetics FastPath gateway unit to connect the Ethernet to the LocalTalk network that the Apple Macintoshes require. We accomplished the connection to the Internet at the Academy by our second day in Budapest. We had only a slight problem determining how to configure the FastPath to the local network. We had expected some difficulty in this area and were pleased that it went as smoothly as it did.

Observations

As we had expected, the TELNET speeds and response time of the Internet in Budapest were relatively slow. However, we were able to accomplish useful work through the Internet, and, in the brief time available to us, from the link. Such work is routinely and operationally done a

Conclusions

- The feasibility of future use of packet radio in Hungary.

It is clear to us, based on our first-hand experience in Budapest with a packet radio extension of the Internet that one or more such extensions would be entirely feasible. At the same time, as our experience highlighted, such packet radio extensions of the Internet will not be implemented merely by acquiring some number of packet radios. Any extensions must be conceived of, planned and managed as network solutions, of which the packet radios are one means of implementing that solution. The staffing of the network both before and after installation is critical to the successful planning, deployment and operation of a packet radio network extension. Thus, staffing must be taking into account in the overall network extension budget.

- The Academy staff

This report would not be complete without special mention of the Academy staff. Their cooperation and efficiency added greatly to the success of this project. This highlights the necessity of taking into account the

critical importance of having support and cooperation
from the organization that is going to provide access to
the Internet for packet radio extensions. In particular
the efforts of Mr. Sandor Manno and Mr. Lajos Monostori
of the Academy staff were most appreciated.

o   The apparent availability of spectrum

The issue of availability of spectrum in general in
Central Europe was beyond the scope of the immediate
project, but we believe that it deserves some
speculation here and further factual exploration.

Through readings and conversations we had been led
to believe that in recent history the spectrum was
scarce in Hungary and elsewhere in Central Europe, due
to its heavy use by the occupying Soviet armed forces.
Whether this was true or not, in the project we found
the spectrum to be relatively clear in the bands that we
were licensed to operate. We speculate that there may
be an abundance of spectrum that can be used to develop
a telecommunications infrastructure in Central Europe
and suggest that this would be a fertile area of
investigation.

I have heard that Novices are allowed Packet Radio privileges. Could
someone explain (briefly, please) how this process works? I'm also aware of
a gateway between Packet Radio and Internet.

Thank you.

Summary: Need help with RS-HT
Keywords: Radio Shack TNC cable

Hi- Due to a recent hamfest, I now have packet capability. After
having read this group for some time, I am excited about getting
onto the packet network. One small snag remains, however. I
cannot find the information I require for constructing a cable
from my Radio Shack HT to the TNC. Since the RS manual that came
with the rig was unclear on the subject, I tried building the cable
shown in the TNC manual for the ICOM2AT, (a radio which a number of people
have told me is similar to the RS-HT.) This cable would allow me
to see other people's packets, but I can't transmit.

If anybody has connected a RS-HT to a TNC and has any advice for
me I would appreciate hearing from you! Even if someone out there
has an inkling of how to figure this out, I would be grateful.

Thanks

I have the AX.25 protocol specification on-line.

Again, I offer to email it to all who directly send me a request by
email.

The file is about 65K bytes and begins:

>   AX.25 Amateur Packet-Radio Link-Layer Protocol
>   Version 2.0 October 1984
>
>
> 2. AX.25 Link-Layer Protocol Specification

>
> 2.1 Scope and Field of Operation
>
>   In order to provide a mechanism for the   reliable
> transport of data between two signaling terminals, it   is
> necessary to define a protocol that can accept and deliver data
> over a variety of types of communications links. The AX.25 Link-
> Layer Protocol is designed to provide this service, independent
> of any other level that may or may not exist.

I don't know what kind of TNC you have, but the Radio Shack and Icom HT's
key the mic by feeding some DC current back into the mic input. The
MJF-1270B that I have had instructions included with it to place a jumper
on the circuit board to do this.

Instead of this, I wired the output from the TNC into a box so that I
could change from the TNC to the mic and foot switch for voice. The
circuit is shown below (switch, mic and footswitch ommitted):

If the TNC still will not key the radio, reduce the resistance. If the recieve light won't light, increase the resistance. This is what worked for my Realistic HTX202.

I hope this helps.

Does anyone run 9600 baud TCP/IP packet on 2 meters? If so, is there a "standard" frequency, and what might it be?

Being part of a team in the Minneapolis/St. Paul area that has just finished putting together a network comprised of TheNet, G8BPQ, and some ROSE nodes - and having just gotten the "bug" to explore TCP/IP, I began to think about how neat it would be if the local TCP/IP network could use the newly available AX.25 resources.

I am looking for answers to:
1. How must the NET s/w be configured to go through the existing AX.25 network?
2. Are changes requires to the TheNet, ROSE and G8BPQ nodes?

With much ROSE activity in Florida and Texas - and our shiny new ROSE link to Dallas/Fort Worth and Tampa (with Chicago coming on-line real soon) just sitting there, I am real anxious to learn how to tie my TCP/IP station into those folks. Any ideas will be appreciated.

The same.

Dale Heatherington, WA4DSY.

After he left Hayes in 1985, the 56K modem was one of many projects
he worked on in his retirement.

AX25DRV was written/designed for at least 20MHz 286 or faster computer.
Your computer will be running out of horsepower trying to create the frames
in software as well as run NET on top. It MAY work on 300 baud < have you
tried this? On HF I mean.

We are using ka9q NOS for that purpose. This is our autoexec.net file. But
we have one problem. There are 3 interfaces in our router. One for A PC net
routing over netbios, one MAC net with "pure" IP. Actually it is the same
cable. The third interface routes to the hospital network. All these are
packet drivers from NOS' point of view. Now to the problem: We can only
route to the "default route", not between the PC and MAC net. Which version
of NOS is the "latest and best"?

The autoexec.net:

```
hostname gw.neurofys.uu.se
ip address [192.36.34.34]
#
# Specify packet driver for "raw" Ethernet packet driver.
attach packet 0x61 ec0 25 1500
ifconfig ec0 ipaddr [192.36.34.34]
#
```

```
# Specify packet driver for NetBIOS packet driver.
attach packet 0x60 nb0 25 1500
ifconfig nb0 ipaddr [192.36.34.65]
#
# Specify packet driver for "Mac" packet driver.
attach packet 0x62 ec1 25 1500
ifconfig ec1 ipaddr [192.36.34.81]
#
# Set up a default, static route to the external router.
route add default ec0 [192.36.34.33]
#
# Set up static routes to each of the machines on which
# the NetBIOS packet driver is operating.
route add [192.36.34.64]/28 nb0
# Mac net
route add [192.36.34.80]/28 ec1

To clarify something. My use of the past tense here may be misleading. I
am not suggesting that Dale isn't around any more. (As far as I know, he
is still doing well and working on tons of projects) It was more to
reflect my ignorance of what he is doing lately.

I'm sorry if someone might have misinterpreted this.

> thanks in advance

> jerry VE7IYB
>

I have a friend (KD4NEW) who is using his DJ580T and a MFJ-1270B.
The following assumes JMP K installed (which adds a .1? capacitor
in series with TNC 1).
TNC 1 is mic audio, TNC 2 is gnd, TNC 3 is ptt, TNC 4 is rec audio.

I would like to find out what software is being used for packet radio.
Especially from those who have used pcPakratt II.

I am currently using AEA's PCPAKRATT II and don't particularly care for
it.

What have you used and how do you like it???????

Someone mentioned PKGOLD... I believe that was the name.... as a good
software.

BTW, I am using AEA's PK2323MBX with the July 90 firm/software.......

Thanks for the info..... if it looks like it's worth publishing any/all
replies I receive, I'll do it to benefit others who may have the same (?)'s

Does anyone out there have the description of the 7+ "protocol"
used for encoding 8 bit data into 7 bit? I guess there might
be some compressing involved, but I really don't know?

Hi Guys and Girls
==========

  I need some HELP "please"
 I intend to build (For my home) a wireless radio network for data
        - Does any one know how to build such a best cheaply ??
        - Can I use some "portable phone" components to do it.
        - How do you detect collision in for such an Network ??
        - What is the best protocol for this ??

Any help is greatly appreciated.

George T. Haber

Hello!

Can anybody point me in the direction where I can find some circuits for
a HF PSK 1200 Baud modem? I believe there is something around called
a PSK-1 modem (possibly originally for JAS-1 FO-12/20 satellites?).

The 14.109 300 Baud FSK BBS Network here in Australia is looking at switching
to 1200 Baud PSK but the local gateway on this net cant afford the cost of
a commercially made modem (which we have been told is around 300$!). We cant
see what would be in the modem that would make it that expensive and
if we can find some circuits are more than willing to build our own.

If anyone has any information please let me know! My E-Mail address is

below.

I am a newcomer to packet, and I am still looking for a TNC or modem to use at my own home(I have been using my radioclub's station).
I have seen a modem for packet advertised on two ham radio magazines, the name of the modem is BAYPAC, (model BP-1). This modem is only about $50 US, that seems reasonable to me.
I would like to hear from some people who use, or have used this modem. How practical is it? What connections does it need?(power, PTT, audio, etc). Have you personally liked it? etc.

Please email or post on this newsgroup.

Thanks in advance,

Hello George:

    How many stations?
    How fast?
    Bidirectional?
    max distance?
    Are you a ham is this for "business" purposes?
    Reliability required? is this a personal security system.
    Minimum range required?
    RS2-232 type connection?

I like the portable phone idea, have pondered it before but to add more than
2 stations (an originate and answer) would require some interesting work.

I have used cheap "K-Mart" toy walkie talkies hooked up to 300 baud modems
for uni-directional links. +'s include few regulations (FCC part 15), cheap.

Hams currently use AX.25 or packet radio which is a CSMA type network allowing
many stations to address data to other stations in a shared medium
using simple FM type radios. Refer to Amatuer radio handbook for more info.
This is a good solution for low throughput turnkey type system. Cost wise

a little expensive. Another problem is the content of your transmissions are somewhat restricted. I am fortunate to have both a base and portable packet station unfortunately rules prevent me from reading my internet mail using ham radio (non-business rule).

If you are not a ham you could perhaps use Radio shack FM type walkie talkies. I have thought of trying this for personal and internet Email type apllications. The big thing is the packet controller must be able to key the tranceiver and I have yet to check if these radios would be compatible.

Any others out there, I wonder if this is in violation of FCC part 15????

I suppose that my solution was running alot of cable. I run serial cable to each room to a rj45 jack. When I want to read net news or get on packet with dinner or in bed just lug the laptop and plug in. To use the 386 I run a remote program like PC-ANYWHERE .Fun Fun.

Good luck lets hear more ideas.

Many many moons ago actually a little over a year ago there was
a thread in this group discussing the need and usefullness of
have standardize cable for connecting ditital devices (TNCs)
to RF devises (radios). I think it started with a simple 5 PIN
DIN connect and esculated to the following all purpose proposal.

To refresh your memory you'd have a cable for each TNC and
a cable for each radio. The end connecotrs of each cable would
mate. This way you could connect any radio to any TNC very
easily.

Since I'm looking at making up some cables I'm wondering if this
was the last work on the subject. Does anybody know of any standards
being worked on or any psuedo standards in use.

Thanks and 73, Tom Kenny KB2GLO, tek@lzusp.att.com

Is this related, or completely a parallel to the COBRA radio interface
standards going on the the UK? Does anyone stateside have a copy of this.
The only lead I have for getting the specification is by sending international
bank drafts to the UK which seems like more trouble than it's worth.

There has been a recent question as to what to about
sunetting and routing for IP routing for ham radio.
I suggested that we subnet (on a psuedo class C subnet) our
44.69.0.0 network for upstate NY. Most of our participants
don't understand routing techniques and think that I
am all wet. There are three schools of thought.

1 continue on, (they're assigning 44.69.0.x for all
of upstate on a per node basis now.

2 subnet each county and preassign a network number to
each. Therefore Rochester would have 44.69.7.0
(Monroe County) and Syracuse area (County it's in)
would have 44.69.9.0, etc.

3 Assign subnets based on need. First come first serve for
each area (switch as they call it, router to me).

Has anyone else done this? I have a subnet in my house and am
routing to the outside from any of my computers. I was
planning on subnetting also by freq. the 2 meter port may
be 44.69.5.0 and the 440 port may be 44.69.6.0. Or we
can split the 44.69.5.{1-127,128-254}.

Next item, has anyone tried to connect two 44.x.x.x networks
through thepublic internet? I'd love to connect Boston to
Rochester via the Corporate Ham clubs (this company has a few
ham clubs all over the world).

Last item, has anyone set up a pure tcpip router (ax25 based) between
areas? Or PcRoute, does it have support for the packet drivers and
ax25? We need to get across the state, but we'd like to do it
without netrom. net1x has been discussed. Any thoughts would be
appreciated.

Thanks very much for leting me get this off my chest...

Hello, I would like some input on policies about forwarding bulletins on 2 meter user freqs. Could anyone acknowledge if there is a national forwarding policy that limits or restricts forwarding bulletins on 2 meters? I would like to hear from you and what kind of agreements have been made and what future outcome will be considered with this "dark ages" practice. This practice is getting many users on the frequency that is happening really upset. Please understand this has been happening for many years now and most of the pbbs's have switched to multi-tnc multi-user software like msys, fbb, cbbs, and so on. However there are 2 remaining systems that are still using the old One user at a time type pbbs's that ARE NOT willing to upgrade their software and at least another tnc for a fwding freq.

I have found out that there is a policy made with these 2 remaining systems that they are not allowed to forward bulletins between the time of 6pm to 11pm since this is prime time. This does not include the serious binary transfers that happen frequently in these time lines. It seems this person with his limited gw basic programming ability is doing all the damage. He and his pal that he sends large .exe files over on his single user pbbs will not upgrade software because A: He doesn't want to use other multi-users software since he programs his own pbbs. B: He don't want to write a mult-user multi-tnc pbbs because he doesn't want to "re-invent the wheel". To top it all off he has the tnc parms set so tight that nobody can get inbetween his packets and the paclen and frames are maxed out so all the other pbbs's in the area are completely held

up during the whole process. Also these 2 pbbs's are using amplifiers
from 80 to 170 watts output. This seems like a complete selfish
act on their part against all of the other users and pbbs's on that
freq.

I personally feel if they want to continue to use 2meters for bulletin
forwarding they should: A: Only get a restricted distrubution.
B: Use Beams instead of amplifiers so it will cut down on the user
interference. C: Reevaluate their worth, are they contributing or
hindering fellow packet operators with their operations. Consider
the future of packet and how large the distrubutions are going to
be an weather single user pbbs's are a asset or a liability to
the community.

Please let us know how you have handled your local areas policy
on this matter so we have a references and a goal to achieve here.

Thanks for your help.
Steve

I am posting this as a warning to other people regarding the service at a
HAM radio store in Los Angeles. This regards Jun's electronics on Sepulveda
in Culver City.

I recently bought an AEA fax at Jun's. As I was very dissatisfied with the
package, I decided to return it. However, it was past the 10 days allowed

to get a refund. They did give me a refund, albeit only $54 of the original $90+tax I payed.

What burns me is that the guy had the audacity of telling me he can't sell it as new, but will only sell it as a demo. When I purchased the unit originally, it was obvious that someone else had used it before. There were pencil marks in the manual and the box was taped with an old piece of masking tape. Being very tolerant I didn't go back to complain (not to mention it wasn't worth the drive)
I returned that thing cleaner and in better condition than when I bought it!

Hey, I have had enough of crooks, dishonesty and poor service. I hope this will serve as a warning to anyone. Buy only from reputable mail order outfits. These local HAM stores are a real dissapointment.

Axel

Hi everybody and greetings from Bangalore, India

Just saw requests for software to be used on packet. Well, PAX is a
neat program written by Raj/VU2ZAP which you could check out. Am
appending Raj's WHATIS.PAX file for more info:

*** WHATIS.PAX

 PAX is a TSR terminal program. Easy to use and many features. Split screen
 for send and receive, scroll back review, capture and file send, print,
 10 brag buffers, automatically sets date and time, 3 color schemes and
 many more .. Interrupt driven, so no drivers required. You can use 9600
 baud between PC and modem even in the slowest machines ! Supports COM 1,2,3
 & 4. Quick switch between 2 modems and any hot key can be selected.
 Download PAX and read the document file for full information.
 NOTE: PAX.COM version 2.10 is 9890 bytes long.

 for syntax "PAX /?" and for Help   "PAX /H"

 * From VU2ZAP Raj * Comments are welcome VU2ZAP@VU2RSB.BLR.IND.AS

***

Anybody who'd like to check it out can drop me a line and I'll mail
you the UUed version with the document. Any queries can be sent to
me on the Internet. (It's faster than the ham route!).

Howdy Netters,

Now I have heard on and off on different parts of the net that there are those out there who are able to get a UUCP feed or SLIP type feed over the radio. Just recently I bumped into a Ham operator who says that it is done all the time.

So my question is, is it possible to get such a feed using an Amiga using AmigaNos? From what I have heard and read AmigaNos was created by a Ham operator to be used over the Air, but that it has been used over phone lines as well.

What I would be specifically interested in would be a small setup using 2Meter or 8Meter. Don't flame me I am not of the Radio world and don't know much. I am just going by what I discussed with this Ham operator recently. I would like to use AmigaNos if that is indeed its purpose or other software suited for this purpose. The Ham operator I talked with Suggested 2 or 8 Meter. I can't remember which of the two he said, but he suggested this format because it was not as expensive and because the Antenna needed would not be a huge affair.

Also, I would like to know. Is there anyone out there in the Amiga Community doing this already. If so, could you please contact me? I would be very interested in talking with you to find out more of what is involved. LICENCES, EQUIPMENT, COSTS, SOFTWARE, Etc...

Thank and take care..

Carlos

  KC6RIX ==> PK232@ALLUS
  "SMARTWATCH CLOCK MOD!"

Hello Fellow Packeteers and PK-232 Users!

Name here is Dino, KC6RIX. I just purchased a new PK-232. While reading the operating manual (yes, I read the manual FIRST!), I came across the SmartWatch option. The SmartWatch option was listed under the
DAytime command (A-34). I did not know what this option did so I dialed up AEA and asked...as I suspected, this option allows the Day/Time clock inside the PK-232 to keep operating after you shut the unit off! This was great for me as I like to see the times on my MHeard list but don't like reseting the clock each time I power up! This little option is ACCURATE too! It was a VERY SIMPLE install and I would like to pass on this info to you...

First, call Dallas Semiconductor @ (214) 450-0400. They are the people that actually build this item!

Next, ask for part number DS-1216-C SmartWatch. It cost me $26.00 and that included shipping!

The SmartWatch should arrive in about three days.

Open your TNC and remove JP-1 (RAM Battery Backup) [I did this so there would be no voltage at the RAM when I removed it. I'm not sure if it was necessary.]

Remove the 32k RAM (62256). [Mine was U-5. Check yours to be sure!]

Install SmartWatch in TNC socket. Make sure the notch on the SmartWatch lines up with the notch on the socket.

Reinstall the 32k RAM on top of the SmartWatch. (Line up notches!)

Reinstall JP-1 for RAM Battery Backup.

THATS IT! THE REST IS AUTOMATIC! Set your clock and you are done with it!

73 My Fellow Packeteers!

DINO...KC6RIX @ WF6O.#SOCA.CA.USA.NA

Hello John,

About the problems you are dealing with...
I received this letter some time ago...

From: n2oqn%w3ya@gw.af2j.ampr.org
To: af2j
Subject: The PK-88 Mod
X-BBS-Msg-Type: P

R:920319/1123z 3283@W3YA.PA.USA.NOAM [State College] Z:16801

Orig: 18-Mar-92 23:41 @:N2OQN #:347

Joe,
     The following is a description of the problem with using the PK-88 without the Mod and the appropriate fix:

(Now that I think about it, I'll write it directly to Adam.

     As I'm sure you well know, Hardware Flow Control is an integral part of a successful Packet Program. This is where the problem lies in using the PK-88 as is with programs like Net/Mac. Specifically, the problem lies in the fact that, although the PK knows how to utilize Hardware Flow Control (HFC), it is not set up correctly for the standard interface cables.
     The NET/Mac software is trying to talk to the PK, in terms of HFC, and the PK isn't looking in the right place (or even better, not on the right pin. HiHi) The fix can be done in two different ways, one which involves

the modification of the cable, or the other one which requires the modification of the TNC itself.

Logic told me that if I ever had to buy a new cable, there would be no problem except for having to modify it also, but... If I ever had to buy a new TNC, I'd be in deep trouble. HiHi. This is why I made the mod to the TNC, NOT the cable. I don't know how to do the mod to the cable, but I do know how to do the mod to the TNC, and it goes as follows:

1) Disconnect power (Duh!) and remove the top cover.
2) Locate the DB25 Connector toward the back of the unit, where you will note that this is the cable going to the computer. RS232. It's a big 25 Pin connector.
3) Just forward of that connector, on the PC Board, you will see 6 resistors, numbered R4 - R9.
4) Note that this step takes place on the connector side. i.e. do the modification to the leads of the resistors FACING the connector. You must 'jump' resistors R5 and R7 together, ON THE CONNECTOR SIDE OF THE BOARD.
5) Replace the top cover. (Duh!)
6) Have Fun!!!

* Note: Not all cables are capable of the hardware flow control needed. In this case, you must find a cable that is (some of them simply don't).
Connect all of the pins required on the back of the mac to the DB25 as necessary. (The Apple Printer cable, as it is called, does NOT work properly, modification or not. Go to an aftermarket cable.)

Well, That's it. Hope this helps you out, and happy soldering. HiHi

73, Danny (N2OQN @ W3YA.PA.USA.NOAM)
| The Penn State University |
|State College, Pennsylvania|

Hope this helps...

==========
From "Intelligence Newsletter", No. 202 (Oct. 8, 1992), Page 5, by O. Schimdt

MAKING THE NEWS AND BOOKSTANDS

The computer virus "threat" is back in the news with a new study by IBM
specialist Jeffrey O. Kephart and on the bookstands with a French do-it-

yourself build-your-own manual on viruses. According to Kephart of IBM's
High Integrity Computing Laboratory, most previous theories on the "social
structure of computer use and networks were faulty": not every machine
could make contact with every other machine in one, two or three "steps".
Most individual computers are not connected to others systems but only
to their nearest neighbors. Therefore, most infections take place not through
networks, but through the physical exchange of disks. Moreover, many of the
1,500 known viruses are not good replicators and many are not destructive.
Even the remaining good replicators are "almost all defeated by normal
anti-virus programs." To advance knowledge such as this concerning viruses,
Chaos Computer Club France (CCCF) has decided to publish the French trans-
lation of "The Black Book of Computer Virus" by Mark Ludwig "which was
censored in the U.S." (French title, "C'est decide! J'ecris mon virus,"
Editions Eyrolles). [...] The book contains "computer codes for writing your
own virus," but according to CCCF any such virus can be defeated by normal
anti-virus programs. Moreover, there is no French law forbidding the publi-
cation of virus computer codes. The book is intended for "responsible adults"
and bears the warning "Forbidden for readers not 18 years old".

When I bought my TNC, it had firmware version 1.1.2. I upgraded the
firmware 2 or 3 times up to version 1.1.8. Now I have a 1.1.2 Manual plus
detached sheets concerning changes introduced with different upgrades and
I am missing some.

I would like to get an electronic copy of the manual so I can edit it
with the changes. I could then laser print a brand new up to date manual.

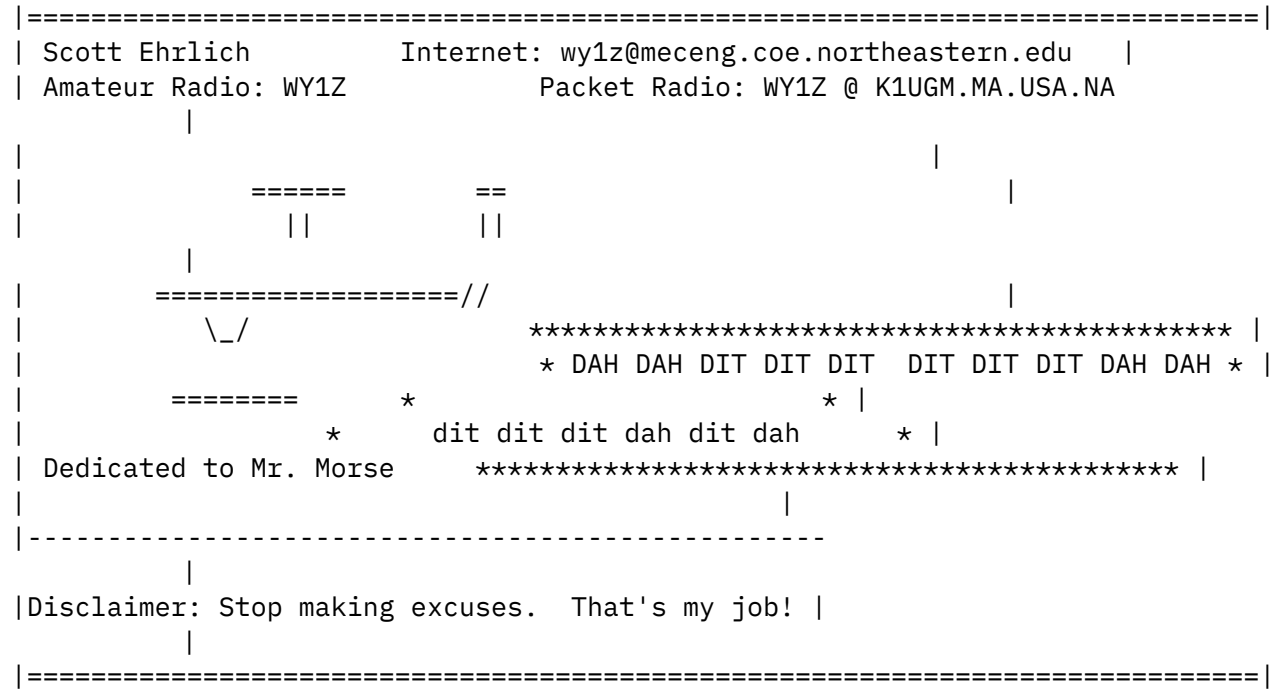
I was wondering if there was anyone in the Brookline/Boston area who was
on TCP/IP packet who I could connect to, at which point I could then connect
to one of the Eastern Mass. TCP/IP switches.



I've tried all the local switches: Switch.Bedford, Stoneham, Needham, Hull,

and I cannot connect to any one of them (just using standard AX.25 'c call').

I live in Brookline, the town next door to Boston, MA.

Thanks much for any info/leads.

Scott (Please note return e-mail address in .signature below).

>higher speed packet.

Just so the newcomer doesn't get confused, it should be pointed out that
voice-grade radios are used for the vast majority of packet work.
When most people refer to "packet radio" they are talking about 1200-baud
TNC's using a standard voice-type 2 meter FM transceiver. High-speed
modems may be the coming thing, but right now they are still the province
of the technical elite.

You need three pieces of equipment: a standard FM voice transceiver,
a TNC (includes the modem), and a terminal or computer. The Commodore
128 should work fine so long as it has an RS-232 port and some kind
of terminal emulation software to talk to the RS-232.

Try asking b-banko@uiuc.edu; he recently declared himself the expert
on this subject. If you need someone who actually knows what he is
talking about, try jbloom@arrl.org or brian@ucsd.edu for a pointer.

I know the corresponding ISO/OSI protocol is FTAM, but the real question is:

Are there any Real ISO People? {Or are they vaporlife like ISO implementations?}

Does anyone out there have any information about POCSAG (Post Office Code
Standardization Advisory Group) signalling? It's the signalling format used
for alpha/numeric pagers (i.e. Motorola Advisor) and was developed in
England. Any information would help (including list of books available).

Thanks,
   Brian

Good morning. It's Sunday the 1st of November and here is the GB2RS news

broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- RSGB Member Morag Howell, GM0MUV, provides communications link as part of the Pentland South Pole Expedition in Antarctica. Members of the society are reminded that Ballot papers should now be sent in for the 1993 Council Election.

Morag Howell, GM0MUV/VP8CME, has been given permission by the Radiocommunications Agency to use the callsign GB4MSS/VP8 from her expedition base camp in the Patriot Hills region of the British Antarctic Territory. She is accompanying Sir Ranulph Fiennes and Dr Mike Stroud, as part of the Pentland South Pole Expedition. Ran and Mike will be attempting to walk unsupported across the Antarctic - a distance of some 2000 miles. There only communication will be with Morag at base camp. She will be located 2850 foot above sea level at approximately 80 degrees South and 81 degrees West. In 1990 as part of a fund raising campaign for the Multiple Sclerosis Society the "North Pole 90" expedition raised over 2 Million Pounds, and they hope to raise the same amount this time. QSL sponsorship will apply again, and Morag will be trying to contact as many amateurs as possible when time permits during her three-month stay. Expect to make contact with her on all HF bands, SSB only from 29th October 1992 until around 10th of February 1993. QSLs should be sent only to the UK GB series Bureaux. We will give regular updates on GB2RS each week to keep you informed of their progress.

Members of the Society should have received their November RadCom and Annual Report by now. Please remember that Ballot papers for council nominations must be received at RSGB Headquarters by 12 noon on the 30th November 1992. If you have not received your November RadCom or Annual Report please contact RSGB HQ as soon as possible.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Antarctica, W6REC will sign KC4AAF from McMurdo Base, from now until the 1st of February. On CW check the frequencies 3505, 7005, 14025, 21025 and 28025KHz, and for SSB the frequencies 7175 and 14180 to 14190KHz.

From Luxembourg, DAGOE,the Dutch Amateurs Go On Expedition group will be active from Wednesday the 4th to Friday the 11th on all bands signing LX/ own call.

From Cocos Island, the call sign TI9JJP will be aired by TI2JJP and possible others, from today Sunday the 1st to Wednesday the 11th of November.

Rally news now, and we know of two rallies for today, Sunday the 1st of November. Today is the last day of the North Wales Radio Rally and Electronics Fair being held at the Aberconwy Conference and Exhibition Centre, Llandudno. Doors open at 11.00 am. There will be many stands including, an RSGB Book stall, club stands and a bring and buy stall. Refreshments will be available as will ample free parking space. Talk-in on channels S22 and SU8. See October's RadCom page 62 for more information.

The North Devon Rally being held at the Holsworthy Memorial Hall, Holsworthy, North Devon. Doors open at 10.30 am.

There are three events scheduled for next Sunday, the 8th:

There is the Barnsley Amateur Radio Rally to be held at Willowgarth Senior High School, Brierley Road, Grimethorpe, Barnsley. Located mid-way between Pontefract and Barnsley, just off the main A628 Barnsley to Pontefract Road. Doors open at 11.00am, 10.30 for disabled visitors, but please note that due to Restoration Work the rally will not be suitable for wheelchair users. There will be the usual trade stands, plus over 20 radio clubs and specialised groups stands, and a large bring and buy stall. The event also offers catering facilities and parking on site. Talk-in will be on channel S22. Further details can be obtained from G4LUE, by telephoning 0226 716339, between 6.00pm and 8.00pm only please.

Next the Mars/Stockland Mobile Radio Rally which is to be held at the Stockland Green Leisure Centre, Slade Road, Erdington, Birmingham. There will be trade stands, a bring and buy stall, free car parking. Further details can be obtained from G8BHE, by telephoning 021 422 9787.

The Tyne and Wear Repeater Group Auction is to be held at the Fencehouses Community Centre, Fencehouses, near Chester-le-Street, Co Durham. Doors open at 10.30am for booking in. Auction to start at 12 noon. Further details can be obtained from Ian, G4OCQ, by telephoning 091 384 0827.

Contest news :

Today Sunday the 1st of November, sees the second of the RSGB's 1296MHz Fixed and SWL Contest which runs from 1600 to 2000GMT. On Monday the 2nd, the fifth and final round of the RSGB 144 CW Cumulative Contest takes place between 2030 to 2300GMT. And on Friday the 6th, the next RSGB's 1.3 and 2.3GHz Cumulative Contest takes place between 2030 to 2300GMT. The 144MHz CW Marconi-RSGB 24 Hour Contest will start at 1400GMT on Saturday the 7th and finish at 1400GMT on Sunday the 8th. Also during Sunday the 8th, the 144MHz RSGB CW 6 Hour Contest will run between 0800 to 1400GMT. For further details on these event, see June RadCom pages 64 and 65.

Repeater news :

The UHF Voice repeater GB3LR on channel RB11, has now been restored to service from a new location in Newhaven, West Sussex. The area covered is Peacehaven, Sleaford, Newhaven and Lewes, and the repeater group would appreciate any signal reports, comments, etc. For further information contact Mark, G6RZA, by telephoning 0273 512247.

The solar factual data:

The period 19th to 25th October has seen a lot of small C class flares and 2 M type, an M1.1/1F on the 19th and a M4.1/2B on the 23rd. A minor mag storm was

forecast on the 23rd but did not materialise. A proton warning was issued on the 26th as this bulletin was being prepared. HF band conditions improved during the period as was expected. The spot count meaned at 133 but rose to 156 on the 24th, the highest level since last July. Solar flux levels increased considerably averaging 142 units but reaching 161 units on the 25th the highest level since last July, these levels are well in excess to what was expected. The geomagnetic activity declined as was expected, with the Ap index dropping from unsettled levels of 16 down to the very quiet level of only 2 on the 24th, with the period averaging only 7.4 units. The state has been nil - nothing to report except for the 26th when the proton alert was issued. The radio quality indices increased from normal up to very good over the period, with the Tokyo, Fort Collins Boulder, and New York circuits reaching excellent by the 25th. The aa indices as supplied by the British Geological Survey for the period 13th to 19th October had daily averages of 36.3 nanoTeslas around quiet levels, though one period around midnight on the 14th was up to 102 nanoTeslas. Bartells rotation 2175 started Oct 24. The Taurids meteor shower reaches its peak on November 3rd but will continue at reduced levels until the 30th.

The ionospheric data for England and Wales:

This week there has been a break down at Slough and not all the data is available, but for the 19th to the 23rd, the F2 daytime critical frequencies at Slough as reported by Appleton, averaged 10.2MHz the highest weekly average since last April. The darkness hour lows averaged 2.6MHz with little variation day to day.

The ionospheric data for the north:

The F2 daytime critical frequencies at EKATERINBERG (pronounced E-KATER-INBERG) formally Sverdlodvsk (pronounced SPHERED-LOVSK) averaged 8.7MHz, and the darkness hour lows averaged 2.9MHz. There is no change in the ionospheric observatory being used in these bulletins, but we have been advised that with all the changes taking place in Russia, the location of Sverdlodvsk is no longer used, and that the location and observatory has reverted to its old location name which is Ekaterinberg.

The solar forecast:

This week, the active side of the sun will be looking our way solar flux levels are expected to be about the 125s the geomagnetic levels are expected to be quiet. With the seasonal changes now being evident, HF band conditions are generally expected to be good, with daytime MUFs up to 30MHz, and darkness hour lows being up to 14MHz.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the

Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S O and G7 N V series, and Novice calls in the 2 0 A D and 2 1 B D series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Good morning. It's Sunday the 1st of November and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- RSGB Member Morag Howell, GM0MUV, provides communications link as part of the Pentland South Pole Expedition in Antarctica. Members of the society are reminded that Ballot papers should now be sent in for the 1993 Council Election.

Morag Howell, GM0MUV/VP8CME, has been given permission by the Radiocommunications Agency to use the callsign GB4MSS/VP8 from her expedition base camp in the Patriot Hills region of the British Antarctic Territory. She is accompanying Sir Ranulph Fiennes and Dr Mike Stroud, as part of the Pentland South Pole Expedition. Ran and Mike will be attempting to walk unsupported across the Antarctic - a distance of some 2000 miles. There only communication will be with Morag at base camp. She will be located 2850 foot above sea level at approximately 80 degrees South and 81 degrees West. In 1990 as part of a fund raising campaign for the Multiple Sclerosis Society the "North Pole 90" expedition raised over 2 Million Pounds, and they hope to raise the same amount this time. QSL sponsorship will apply again, and Morag will be trying to contact as many amateurs as possible when time permits during her three-month stay. Expect to make contact with her on all HF bands, SSB only from 29th October 1992 until around 10th of February 1993. QSLs should be sent only to the UK GB series Bureaux. We will give regular updates on GB2RS each week to keep you informed of their progress.

Members of the Society should have received their November RadCom and Annual Report by now. Please remember that Ballot papers for council nominations must be received at RSGB Headquarters by 12 noon on the 30th November 1992. If you have not received your November RadCom or Annual Report please contact RSGB HQ as soon as possible.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Antarctica, W6REC will sign KC4AAF from McMurdo Base, from now until the 1st of February. On CW check the frequencies 3505, 7005, 14025, 21025 and 28025KHz, and for SSB the frequencies 7175 and 14180 to 14190KHz.

From Luxembourg, DAGOE,the Dutch Amateurs Go On Expedition group will be active from Wednesday the 4th to Friday the 11th on all bands signing LX/ own call.

From Cocos Island, the call sign TI9JJP will be aired by TI2JJP and possible others, from today Sunday the 1st to Wednesday the 11th of November.

Rally news now, and we know of two rallies for today, Sunday the 1st of November. Today is the last day of the North Wales Radio Rally and Electronics Fair being held at the Aberconwy Conference and Exhibition Centre, Llandudno. Doors open at 11.00 am. There will be many stands including, an RSGB Book stall, club stands and a bring and buy stall. Refreshments will be available as will ample free parking space. Talk-in on channels S22 and SU8. See October's RadCom page 62 for more information.

The North Devon Rally being held at the Holsworthy Memorial Hall, Holsworthy, North Devon. Doors open at 10.30 am.

There are three events scheduled for next Sunday, the 8th:

There is the Barnsley Amateur Radio Rally to be held at Willowgarth Senior High School, Brierley Road, Grimethorpe, Barnsley. Located mid-way between Pontefract and Barnsley, just off the main A628 Barnsley to Pontefract Road. Doors open at 11.00am, 10.30 for disabled visitors, but please note that due to Restoration Work the rally will not be suitable for wheelchair users. There will be the usual trade stands, plus over 20 radio clubs and specialised groups stands, and a large bring and buy stall. The event also offers catering facilities and parking on site. Talk-in will be on channel S22. Further details can be obtained from G4LUE, by telephoning 0226 716339, between 6.00pm and 8.00pm only please.

Next the Mars/Stockland Mobile Radio Rally which is to be held at the Stockland Green Leisure Centre, Slade Road, Erdington, Birmingham. There will be trade stands, a bring and buy stall, free car parking. Further details can be obtained from G8BHE, by telephoning 021 422 9787.

The Tyne and Wear Repeater Group Auction is to be held at the Fencehouses Community Centre, Fencehouses, near Chester-le-Street, Co Durham. Doors open at 10.30am for booking in. Auction to start at 12 noon. Further details can be obtained from Ian, G4OCQ, by telephoning 091 384 0827.

Contest news :

Today Sunday the 1st of November, sees the second of the RSGB's 1296MHz Fixed and SWL Contest which runs from 1600 to 2000GMT. On Monday the 2nd, the fifth and final round of the RSGB 144 CW Cumulative Contest takes place between 2030 to 2300GMT. And on Friday the 6th, the next RSGB's 1.3 and 2.3GHz Cumulative Contest takes place between 2030 to 2300GMT. The 144MHz CW Marconi-RSGB 24 Hour Contest will start at 1400GMT on Saturday the 7th and finish at 1400GMT on Sunday the 8th. Also during Sunday the 8th, the 144MHz RSGB CW 6 Hour Contest will run between 0800 to 1400GMT. For further details on these event, see June RadCom pages 64 and 65.

Repeater news :

The UHF Voice repeater GB3LR on channel RB11, has now been restored to service from a new location in Newhaven, West Sussex. The area covered is Peacehaven, Sleaford, Newhaven and Lewes, and the repeater group would appreciate any signal reports, comments, etc. For further information contact Mark, G6RZA, by telephoning 0273 512247.

The solar factual data:

The period 19th to 25th October has seen a lot of small C class flares and 2 M type, an M1.1/1F on the 19th and a M4.1/2B on the 23rd. A minor mag storm was forecast on the 23rd but did not materialise. A proton warning was issued on the 26th as this bulletin was being prepared. HF band conditions improved during the period as was expected. The spot count meaned at 133 but rose to 156 on the 24th, the highest level since last July. Solar flux levels increased considerably averaging 142 units but reaching 161 units on the 25th the highest level since last July, these levels are well in excess to what was expected. The geomagnetic activity declined as was expected, with the Ap index dropping from unsettled levels of 16 down to the very quiet level of only 2 on the 24th, with the period averaging only 7.4 units. The state has been nil - nothing to report except for the 26th when the proton alert was issued. The radio quality indices increased from normal up to very good over the period, with the Tokyo, Fort Collins Boulder, and New York circuits reaching excellent by the 25th. The aa indices as supplied by the British Geological Survey for the period 13th to 19th October had daily averages of 36.3 nanoTeslas around quiet levels, though one period around midnight on the 14th was up to 102 nanoTeslas. Bartells rotation 2175 started Oct 24. The Taurids meteor shower reaches its peak on November 3rd but will continue at reduced levels until the 30th.

The ionospheric data for England and Wales:

This week there has been a break down at Slough and not all the data is available, but for the 19th to the 23rd, the F2 daytime critical frequencies at Slough as reported by Appleton, averaged 10.2MHz the highest weekly average since last April. The darkness hour lows averaged 2.6MHz with little variation day to day.

The ionospheric data for the north:

The F2 daytime critical frequencies at EKATERINBERG (pronounced E-KATER-INBERG) formally Sverdlodvsk (pronounced SPHERED-LOVSK) averaged 8.7MHz, and the darkness hour lows averaged 2.9MHz. There is no change in the ionospheric observatory being used in these bulletins, but we have been advised that with all the changes taking place in Russia, the location of Sverdlodvsk is no longer used, and that the location and observatory has reverted to its old location name which is Ekaterinberg.

The solar forecast:

This week, the active side of the sun will be looking our way solar flux levels are expected to be about the 125s the geomagnetic levels are expected to be quiet. With the seasonal changes now being evident, HF band conditions are generally expected to be good, with daytime MUFs up to 30MHz, and darkness hour lows being up to 14MHz.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S O and G7 N V series, and Novice calls in the 2 0 A D and 2 1 B D series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

That is not correct exactly. The GRAPES 56k modem IS an rf modem, but
the output is only about 1 milliwatt, and is in the 28mhz ham band. It
MIGHT be usable with another if they were separated by a few feet. The
standard use is to drive a 220 or 430 Mhz transverter.

> Is this correct...and if so where can I purchase it.

If you are a ham radio operator, you could access another system if
they have the equipment too. The modems are NOT plug and play. They
are in kit form, and require a power supply, and a device such as the
Ottowa PI (packet interface) card, or a modified TNC to provide I/O
from the computer.

Kits can be ordered from GRAPES, Inc, Alpharetta, GA. If you need the
full address, drop me a line, and I'll e-mail you the full address and
more info.

No. The grapes modem puts out an IF in the HF band, but you still
need to convert that to 440 and amplify it. Send email to Doug Drye,
KD4NC gatech!kd4nc!dug or Chris Wren jcw@bold1.gatech.edu.

> if I have this set up can I both read Usenet and

I won't get into the usenet-on-packet argument.

Good luck.

Ok, the GRAPES 56 kb modem is great, but you need a matching modem at the other end to do anything with it. Right now there aren't a lot of them installed in the SF area so I don't know that you could get the connection you want. The modem is a true RF modem, but it's output is in the 10 meter band and you require a transverter to put the signal on a UHF frequency where such high baudrates are legal here in the US. We've used several different transverters from the Microwave Modules units to the Hamtronics unit to the new design by Rick Campbell that was featured in QST. The total system price with transverter and interface card is in the $600-$700 range, less if you can scrounge a used transverter. That's about what it would cost to go buy a TNC and a new voice radio, but the thruput is 49 times greater with the high speed modem.

As N1AL noted, this isn't a project for the casual beginner. You need access to a dual channel scope and a frequency counter to get the system up and running. If you've built a couple of kits, and have access to the test equipment, the scope only has to have a bandwidth through 100 kHz, then it's a good project. There aren't any tricky parts to it and it goes together easily. I've built 5 of them. But if you don't know anything about packet, you might be better off starting out with the traditional radio and TNC. Just don't get discouraged by the low thruput of those systems because there *is* something better available. If you want more detailed information on

the modem, Email me and I'll send you some information on it, or there
is a complete technical write up on it by the system designer in the
6th ARRL Computer Networking Conference Proceedings.

Please excuse me if someone has recently asked the same question:
Are any of the commercially available transceivers for the 220 MHz band
ready to accept 9600 baud operation for packet? We also considered using
440 MHz, but 220 MHz activity is nearly dead around here and it would
be much more quiet than 440 MHz. If there are several rigs which fit
the bill, which ones have you had experience with, good or bad?

Thanks in advance for the info. Please send replies directly to me.

Proposed is a new moderated group, rec.radio.info. This group should carry informational posts such as the radio FAQs, Solar Reports, ARRL Bulletins, RACES Bulletins, Keplerian elements, AMSAT Bulletins, Amateurs on USENET list, Elmers List, SCDX postings and others too numerous to mention. Also informational posts in the other rec.radio.* groups may be reposted in this group (either at the request of the poster, or by one of the moderators).

For the benefit of those of you that don't understand the current rec.radio.* hierarchy:

```
rec.radio.amateur.misc      Amateur Radio practices, contests, events
                        and other discussions.
rec.radio.amateur.packet    Discussion about packet radio setups.
rec.radio.amateur.policy    Amateur Radio practices, rules, etc.
rec.radio.swap              Offers to trade and swap radio equipment.
rec.radio.noncomm       Non commercial radio discussions
rec.radio.shortwave         Shortwave Radio discussions.
rec.radio.cb            Arguments about Linears and whose stick is
                        bigger
rec.radio.broadcasting      moderated group about broadcast radio
```

Non of these groups would change, but the hopes would be that the informative posts from each of these groups end up in the proposed new group rec.radio.info. Other proposed names for the group that have been made are: rec.radio.answers, rec.radio.info, rec.radio.announce, rec.radio.amateur.news, rec.radio.news so a choice for a name for this group is also up in the air.

The moderator that has volunteered is Mark Salyzyn (mark@ve6mgs.ampr.org) along with, I hope, several co-moderators that make up the list of informational post contributors. So far Paul W. Schleck (pschleck@cwis.unomaha.edu) has volunteered to be one of the co-moderators.

I will try to set up an archive for this new group, but hopes are that there will be a volunteer with a better connected (ie: ftp'able) site arranged.

Paul has also agreed that, once vote is to be taken in 30 days, he will tally the votes. The voting addresses will be presented at the RFV, so DO NOT VOTE NOW!

Followups to news.groups. Please do not send me e-mail, as I am not the person you need to convince as to the validity/invalidity of this group. I leave that up to net-wisdom.

Gentleman, start up your engines!

```

As if the subject doesn't say it all... I need a cable to connect my Alinco
DJ160T HT to an *old* MFJ 1270 TNC. Or perhaps a list of connections...

I noticed that the designer of the 56K modem is named Heatherington. Is
this the same Heatherington who invented the escape sequence used by Hayes?

Subject: DRSI & BPQ problem
Message-ID: <1992Nov1.231412.22812@cs.tcd.ie>
Summary: Interrupt problem with BPQ driving a DRSI card
Keywords: BPQ DRSI
Organization: Computer Science, Trinity College Dublin
X-Newsreader: TIN [version 1.1 PL6]
Date: Sun, 1 Nov 1992 23:14:12 GMT
Lines: 27

Does anyone have any experience of known working drsi cards (type 2s)
having a timing or interrupt problem when driven with bpq software?
We have tried all combinations of interrupt and address settings.

The symptoms with the cards are a long drawn out garbled transmission
when using pac4 to get at bpq. Also the cards do not decode packets.

One card works fine (well we get lots of crit errors?) with the DRSI
supplied tnctsr-s program when driven by AA4REs BBS. This is running
in a 'turbo' 8088. BPQ makes the long drawn out noises in this
machine.

The other works fine (with bpq) in a 20MHz 386DX, but exhibits the
above symptoms in a 40MHz 386DX machine.

DRSI in a fax have suggested investing in faster cmos parts for the

card which goes in the 40MHz 386. I am not sure about the sense
behind this though.

The manual talks about the removal of a pull down resistor in the
event of timing problems when running their software. But it fails to
document where it is on the board.

Does any of this sound familar? If so HELP!

73 Paul

This is a long shot, but has anyone written sortware
for the hp-48sx to drive a baycom or poor mans packet
setup? I understand that it's pretty easy to hook up a regular
TNC to an HP, but I wanted to do it with a home brew tnc.

thanks!

Proposed is a new moderated group, rec.radio.info. This group should carry informational posts such as the radio FAQs, Solar Reports, ARRL Bulletins, RACES Bulletins, Keplerian elements, AMSAT Bulletins, Amateurs on USENET list, Elmers List, SCDX postings and others too numerous to mention. Also informational posts in the other rec.radio.* groups may be reposted in this group (either at the request of the poster, or by one of the moderators).

For the benefit of those of you that don't understand the current rec.radio.* hierarchy:

```
rec.radio.amateur.misc      Amateur Radio practices, contests, events
                        and other discussions.
rec.radio.amateur.packet    Discussion about packet radio setups.
rec.radio.amateur.policy    Amateur Radio practices, rules, etc.
rec.radio.swap              Offers to trade and swap radio equipment.
rec.radio.noncomm       Non commercial radio discussions
rec.radio.shortwave         Shortwave Radio discussions.
rec.radio.cb            Arguments about Linears and whose stick is
                        bigger
rec.radio.broadcasting      moderated group about broadcast radio
```

Non of these groups would change, but the hopes would be that the informative posts from each of these groups end up in the proposed new group rec.radio.info. Other proposed names for the group that have been made are: rec.radio.answers, rec.radio.info, rec.radio.announce, rec.radio.amateur.news, rec.radio.news so a choice for a name for this group is also up in the air.

The moderator that has volunteered is Mark Salyzyn (mark@ve6mgs.ampr.org) along with, I hope, several co-moderators that make up the list of informational post contributors. So far Paul W. Schleck (pschleck@cwis.unomaha.edu) has volunteered to be one of the co-moderators.

I will try to set up an archive for this new group, but hopes are that there will be a volunteer with a better connected (ie: ftp'able) site arranged.

Paul has also agreed that, once vote is to be taken in 30 days, he will tally the votes. The voting addresses will be presented at the RFV, so DO NOT VOTE NOW!

Followups to news.groups. Please do not send me e-mail, as I am not the person you need to convince as to the validity/invalidity of this group. I leave that up to net-wisdom.

Gentleman, start up your engines!

-------- Recommended description -------
Newsgroup:
     rec.radio.info (moderated)

/usr/lib/news/newsgroups entry:
     rec.radio.info   Informational postings related to radio.

Charter:
     To provide high quality, informational postings about radio.
     This group will be used to segregate information from the
     regular discussions streams, such as rec.radio.amateur.misc, to
     alieviate the traffic in these discussion groups. Also, by
     placing the informational postings in this group, make it easier
     for many to find radio related information.

     By maintaining a high level of quality in the postings, it is
     hoped that these postings may end up, at least more conveniently,
     over the Amateur Radio Packet BBS network as well through the
     various gateways.

     By using a co-moderator scheme, the hopes are that many of the
     postings will maintain timeliness, and good propagation through
     the computer networks.

Hi,
as long as a PC clone does not have complete handshake lines, as f.i. the
AMIGA Portfolio, BayCom software cannot be run.
The handshake lines are used for data and emulation of NRZI encoding and
decoding hardware.
Poor man's packet may run, because its dependant from the parallel port.
73s, Fritz

Hello Paul,

It looks like a problem we had going from an XT to a '386 machine. For
some reason, the card would not respond to the interrupt line on the
newer computer. Solution? We used a different interrupt.

I have got an XT that runs at 10 MHz. I've also got a baycom modem that runs
great with Baycom. Now I would like to upgrade to TCP/IP with the AX25.COM
and the NOSPJ.EXE software, but these wont work! The RX misses most packets
and the TX sounds weird. I have monitored the band with my second rig and
even if packets are repeated fail to be received by the system. Is there any
cure to this problem?

: It looks like a problem we had going from an XT to a '386 machine. For
: some reason, the card would not respond to the interrupt line on the
: newer computer. Solution? We used a different interrupt.
:

: 73, Erich

Telling bpq the wrong irq intentionally makes a working card produce
the wailing sounds. Anyway we mucked around with bpq some more,
cleaned the contacts on the edge connector, changed irqs (again)
and magically it works on the 8088. BPQ does the job a lot better
than the drsi tnc tsr software.

Still trying to figure out why a new card in a new 40MHz 386 machine
won't respond, after trying lots of irq options. But I am still hoping
that its clashing irqs.

Greetings,

I am trying to get several of my fellow hams up on TCP/IP using the WNOS
version 4A1 code. It provides a fine end node on an AT (80286) or 80386
system. However, when I try to run it on an XT (8086 ?) system it does a
short pause and drops me back at the DOS prompt with no error message what
so ever. I have tried this on two different XT systems and both had 640kb
of memory. Is there something that I am over looking?

If I can't run WNOS on an XT can somone recommend a feature rich NOS version
that will run on a XT?

Any help greatly appreciated.......

I am intered in getting into packet radio with my C-128. I see the MFJ-1271
TNC advertised $50. Is this a good (reliable) beginner TNC? Anyone know of
another that would be better?

Also, what packet freqs are used in the Houston area?

Thanks,

I was also unsuccessful at getting WNOS to work on a PS/2 model 30 -- this
is also a 8086 based computer. However WG7J NOS 1.04 works on this machine
as does PA0GRI NOS 911229 2.0m

Sorry if this is an FAQ, I don't read this group regularly.

I am interested in building a simple packet modem and writing all the
AX25 software necessary to get going on packet on my computer (Acorn
A3000). Looking around the ftp sites (and on archie) I have totally
failed to find a description of the protocol. I am a total novice, not
even knowing what audio frequencies are used, which makes it slightly
difficult for be to get started!

Could someone please point me to an on-line description of the protocol,
or a good book describing it.

Please reply via email, and I'll summarise to the group.

Alun.

p.s. I have looked on the buffalo ftp site but couldn't find it there...

I've been planning on building one of the 3105 (?) based modem units to
use for local packet. The computer I have right now is a Macintosh,
so I would be using the SoftKiss driver and NOS for the Mac.

I had planned on building the Poor Man's Packet modem. I thought that
it was the same as the Baycom, but now I think I've got it wrong.
Also, there was an article in 73 (?) this month with yet another
design specifically for the Macintosh.

Can someone please comment on the relative merits of these three
designs? I'd like something that would also work on a PC, but
that isn't critical. The ability to use software that is to
some extent standard and supported is important.

Thanks for the info.

I have a little problem. I breadboarded the PMP modem about 2 months back and
got it to work fine. Well as soon as the challenge was over I became interested
in another project. So after 2 months of stealing parts from and replacing
parts back to the breadboarded modem, I wanted to get it fired up again.
I have made sure all the parts are back and in their correct position, but the
modem doesn't work.

What I need to know is:

1) If you have built one of these and you run pmptest, if no signal is coming in on the radio, does the receive indictor stay lit? Well, mine does and I don't remember it doing this before when it worked. What it is doing now is receive indicator on even with no activity, then when there is activity, CD being lit and receive blinking like it should. The point to the whole matter is that when in the pmp program, the modem is not decoding. (BTW, I have spent 2 whole saturdays trying every combination of tuning to no avail).

2) I have a couple of the modem chips, TCM3105, and can't get either of them to work (same problem with both). Are the chips so sensitive that I could have damaged both chips, and that is the reason for the problem?

I would appreciate any help.

Thanks in advance.

Date : 921103/1233
Msgid : BF 60402@K6IYK, 4221@WB6CYT-2 $WESNETSPCL.1
Subject : BBS COORDINATION IN SO. CALIF.
Path : WB6YMH!K6VE!KB6JES!K6IYK

In order for the Amateur Packet BBS Forwarding Network to function effectively it is necessary for everyone involved to cooperate for the good of the whole. One such form of cooperation is represented by the WESTNET.BBS List published by this station. BBS Stations throughout the eleven Western States subscribe to a common set of guidelines that help make the system what it is today. The specific operations applicable to each State or Regional Area are decided locally but Standards such as those documented in the Southwestern Division Routing and Distribution Designators Document (RDDDOC) have been accepted by most of the Western Area and much of the rest of the US.

Becausing of the increasing demand for BBS services and the growing complexity associated with issuing and maintaining the WESTNET.BBS List, effective immediately this station will begin conducting a more formalized coordination process in the designation of Southern California WESTNET BBS Stations. The Southern California Association of Packet SYSOPs (SCAPS) voted at their October meeting to support such a process and WA6FWI was given the action to collect ideas and proposals from existing members and prepare them for general consideration. Once SCAPS has defined the coordination procedures to be used in Southern California, I will recognize stations coordinated under those procedures. In the meantime, I will utilize the following process.

A. Stations will be recognized into the WESTNET BBS System once they meet the following qualifications:
   1. Stations will provide Full Service Systems which include Message/ Bulletin Services, File Storage and Retrieval Systems, and System HELP Functions.
   2. Stations will accept, and forward as required, all legal message traffic. Bulletins are to be retained consistant with the needs of the user community and consistant with the capabilities of the BBS hardware and software. Bulletin forwarding shall be performed in accordance with the latest RDDDOC definitions and NTS support shall be in accordance with the definitions found in the CASZIPS documents.
   3. Stations are expected to minimize forwarding activities on User frequencies and shall maintain a port on a designated trunking (forwarding) frequency.
   4. Stations will operate on designated User frequencies consistant with the bandplan applicable for their area. Interference with other WESTNET BBS Stations and adjacent cellular assignments is to be avoided.
   5. Stations will comply with the policies of the local SYSOP organization and will support only those other BBS stations who also comply.
   6. Forwarding to Personal MailBoxes within the designated service area of the BBS is encouraged. However, the personal mailbox may only serve a single household and the WESTNET BBS Callsign must be represented as the HomeBBS of the mailbox owner.
   7. A category of Special Service WESTNET BBS Stations exists to cover systems which provide unique services to the network (e.g.; HF

Forwarding, Intersystem Bridging).

B. Stations in Southern California who wish to operate a WESTNET BBS system under the above guidelines should submit a request for coordination to this station. The request should include:
   1. Callsign of BBS and SYSOP (if different).
   2. SYSOP Name, Address, and Telephone Number.
   3. Proposed location of BBS.
   4. Proposed BBS software.
   5. Proposed User Port(s) frequency, output power, and antenna type.
   6. Proposed Trunk Port(s) frequency, output power, and antenna type.
   7. WESTNET Sponsor. (New SYSOPs are expected to discuss their intentions with an existing WESTNET BBS SYSOP and obtain assistance in identifying where they can best fit into the network. Initial forwarding will normally be provided by the sponsor.)
   8. Special service conditions if not a Full Service System.

C. The WESTNET Coordinator, with the help of the Sponsor, will assist in determining the best operating environment for the proposed system. Once an initial environment has been defined, the Coordinator will send a Notice to all local SYSOPs informing them of the intended operation and defining the term of the trial period (normally 30 days). Successive trial periods will be utilized if the new system's operating conditions are considered unsatisfactory by the WESTNET Coordinator and/or the Sponsor.

D. Upon successful completion of a trial period, the WESTNET Coordinator, will finalize the forwarding responsibilities of the new system and add the station to the WESTNET.BBS Listing.

E. WESTNET.BBS stations which fail to comply with the policies of the Network are subject to removal from the WESTNET.BBS List. Stations so de-listed will not be supported by other members of the Network.

James T. Fortney, K6IYK
WESTNET.BBS Coordinator

I thought about mailing a reply, but thought that this topic was of
sufficient general interest to post the reply instead.

Although I don't know about the HP 48SX, I have tried the Baycom rig
with the HP95LX (the bottom line is that it doesn't work).

The problem is that the Baycom packet "box" uses the RS-232 serial port
in a -- to be charitable -- "unusual" way (power comes in on the RS-232
signal line which is held at logic "1" and the data/PTT signals are
brought in on the RS-232 "control" lines such as DTR, DCD, etc.)

The 95LX (and, I assume the 48SX) implements a 3-wire RS-232 connection

(data IN, data OUT, ground) and thus doesn't implement the "handshake"
lines. However, I use (and love) the Baycom box with my desktop. I
bought Paccomm's "Handipacket" for truly portable packet.

Time ago I wrote to Michael Chace about the same problem.

From his letter:

(my question)
(...) on my Olivetti M240/At&T6300, 8086 based 640K RAM computer -
       EVERY executable doesn't work
      (Every time it returns back to the DOS prompt!).

(answer)
     You should have told him that you had an 8086 based machine.
     WNOS4 is usually only distributed compiled for 286 and above
     since it does not work well on some (slow) 8086 machines.

("him" refers to the person who compiled my executables).

So there should be an option to be set before compilation.

"May the Force be with you"

I am looking for a primer on 9600 baud packet operation.
What are the most common modems, cost, radios, bands, etc.....

Is there 1 "standard" for 9600 baud transmissions, or are there many?
I am somewhat confused as to why a special radio is needed.
Are there 9600 baud modem kits?

Thanks!
Eric

=-=-=-

This subject is discussed in the WNOS4 Distribution Documentation
and so should come as no surprise. If you got the program and not
the full release pack, why not ?

Just in case, did you check if the executable you had was compiled
for 8086 mode instructions ? May sound stupid, but it happens :-)

Cheers, Mike (G6DHU)

I've jumped all over Kantronics case about this. While the TNC2 uses a
hardware timeout, a non-retriggerable one shot in series with the PTT line,
Kantronics does it in software. So when the program goes astray due to a
glitch, it can lock in transmit forever. Stupid design that saves 10 cents
and costs a $400 radio.

Of course the one shot could fail, but I haven't heard of a case of that
while I have heard of many cases of Kantronics brilliant firmware going
ga-ga. I prefer a TNC2 with K3MC's KISS only firmware. Never had a lock
up or failure to function. Now we could talk about the stupid opamp for
a RS-232 driver, but that's another story.

>Does anyone have information on the rumored port of NOS to the Kantronics

I am the author of the port of NOS to the DE, called JNOS40. It is
a stand-alone version of NOS, targeted at switches. A lot of the features

that are found in the pc version of nos i produce (called jnos) are in it...

>Data Engine? When might it be available?
The code is currently in beta testing. Current beta is 0.97, dated 8/30/92
0.98 will be going to the betatesters next week,
and i suspect the public release not too long after that, if things
turn out well.

>Will it support a WA4DSY modem
>on one of its ports & a 38.4k baud SLIP connection on its other port?
I am not sure what kind of interface the WA4DSY 56k modem has, but if
it is a type A,B or C modem (in Kantronics terms), it will work.
I recall vaguely that the DSY stuff does it's own clocking, so that should
work fine (with some interfacing offcourse)
I've tested stuff up to 19200 halfduplex using the DE9k6/19k2 with D4-10's,
and fullduplex loopback up to 56k.

Serial port is a bit different story; due to a hardware design of the DE9k6,
there is a performance hit that causes characters to be misses at speeds
> 9600. This might not be the case using other modems...

>What about a console interface? Price?
Currently, it is meant to be standalone. Ie, no 'terminal' connections (yet)
There is a console mode, that allows you to execute any of the available
command, and see trace output from the 2 internal ports, but NO outgoing
connections are supported.
This is however planned for future releases...

Once everything is ready for the public release, the binaries will be
placed in the public domain, so it's free !
I am working on quite extensive documentation on configuring things etc,
and that will all go with the released stuff.

Hope this informs a bit; keep an eye on this group for release info...

You (or the other poster) edited out the part of my posting where I
chastised Kantronics for not putting something in the manual about the
lack of a timeout timer. Since nearly all other TNC's have such a timer,
I assumed the KPC-2 did too.

Really? How did you determine that it was Windows 3.0, and not just a program
that just made a window like interface? And what made you assume that it
runs under a PC? I have ZIP and UNZIP that run under unix. Just being
"a packet terminal program" is a pretty wide charter to run under.

Paul did a very nice job of describing the program in his response to my query.
It's a shame thknowledge
at yours did nothing to further the knowledge of this program.

There are problems in the listings for Kansas anyway.
Many machines, including mine, that should be listed:

o(ca)ez

open repeater, closed autopatch, 911, emergency power

are instead listed:

ocez

I do not know what an open closed repeater is.
The repeater council and the ARRL seem to blame each other for mistakes.

Has anyone ever been able to really figure out what causes the backoff timer
to kick in during an ftp session?

The reason I ask this question is that during an extensive series of ftp
sessions across several local lans I discovered some interesting anomolties.

Currently have tcp settings of:

tcp mss 216
tcp window 432
tcp irtt 5000

hopefully to reduce the overhead of oustanding packets, etc>

After establishing a couple of ftp sessions with a single station which is also a Mac. I started the xfer process and everything seemed to be going OK. File sizes were 169K and and 91K using type i and macbinary enabled. They were StuffIt archives.

After while I did a check of the status with the "t e #" command and not too much of either file was xfered. I left the station go at it overnight and the next morning the files were only about half done! Came back after work (9 hours later) and the files were about 3/4 complete.

I decided to look at the activity on frequency with the trace ax0 111 command and it didn't look too bad. So I decided to kick the sessions for awhile and things got moving again. I came back in about 2 hours and both files were finished!

So I guess I have to ask this question..... does having the trace mode on in an active window have anything with the operation? The channel activity seemed to be about the same during the period. Sure is suspicious?

Another thing I don't understand ise routing statements. I put a couple of statements in to bypass our local switch and go to another station who has a very good path to another Mac station. I placed in my autoexec.net the following lines to cover this

route add [44.56.a.a] ax0
#for the station who I need to go to access this other station

route add [44.56.b.b] ax0 [44.56.a.a]
#this line to cover the routing to the station I want to talk to

If I ping station "b" it goes to the switch! If I ping station "a", it bypasses the switch and goes to him directly!

Now if I add these lines in manually from the console window, substituting their ax.25 calls instead off their IP addresses... it works the way I would expect. What did I do wrong?

Any help here would be greatly appreciated.

73 for now.... c u on the shortwaves

Good morning. It's Sunday the 18th of October and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

And we start this week by wishing a special good morning to all the scouts and guides taking part in Jamboree On The Air.

The Radiocommunications Agency has recently announced its continuing support for Project YEAR - Youth into Electronics via Amateur Radio - with a further two years of sponsorship of the Young Amateur of the Year Award. The announcement was made by senior RA official Steven Spivey at this year's Young Amateur of the Year presentation at the RSGB HF Convention. A full report on the ceremony appears in the November edition of Radio Communication which is due to be posted to all RSGB members this week.

Enterprises By The Blind is looking for volunteers to read parts of RadCom onto cassette tape. Anyone interested is asked to contact Mr Gerrard, G3LAZ, on 0582 27588.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO: From Minami Torishima, JK1ABP will be active from now until January 1993 on all Bands using SSB, CW and Packet. JK1ABP will sign JA9IPX/JD1 on the normal HF bands but JK1ABP/JD1 on the WARC bands. From Galapagos Islands, N6KT will sign HC8A from now until Sunday the 25th of October. From the US Virgin Islands, CT1BOH will be active from today, Sunday the 18th until Saturday the 31st October as KP2/CT1BOH. During next weekend's CQ World-wide SSB contest he will sign KP2A. From Canada, AH9B will be active as AH9B/VO2 from Western Labrador in CQ Zone 2 from Tuesday the 20th to Monday the 26th of October, mainly on 80 and 40 metres CW and SSB. During the CQ WW SSB contest he will be active on all bands. From Fernando de Noronha, PP1CZ will be active as PY0F/PP1CZ from this weekend until Saturday the 31st of October. During the CQ contest he will sign PU0F.

Rally news now, and we know of no rally for this weekend, and only one rally scheduled for next weekend: The Leicester Amateur Radio and Electronics Exhibition will be held at the usual venue, the Granby Halls, Aylestone Road, Leicester. This year the exhibition is to be held on Friday the 23rd and Saturday the 24th of October. Doors open at 10.00 am, or 9.30 for disabled visitors. The event features an extensive trade exhibition, an RSGB Book and

Information stand and a bring and buy stand. Refreshments will be available. Talk-in is to be on channels S22 and SU22 using the callsign GB2GH. For a complete guide, see the centre section of October's RadCom. Further details can be obtained from Frank Elliott, G4PDZ, by telephoning 0533 871086.

Contest news next:

Today, Sunday the 18th, the RSGB 21MHz CW Contest takes place between 0700 and 1900GMT. Exchange RST, a serial number starting 001 and the RSGB County Code which can be found in the January 1992 edition of RadCom. The full rules are on page 66 of April's RadCom. Next weekend the CQ World-wide DX SSB Contest takes place from 0000 on Saturday the 24th, to 2400 on Sunday the 25th. All bands 160 to 10 metres will be used, excluding the WARC bands. See October RadCom page 19 for brief information. Another in the RSGB's 1.3 and 2.3GHz Cumulative series takes place on Wednesday the 21st of October. It runs from 1930 to 2200GMT. See June RadCom page 65 for further details.

From Monday the 26th to Friday the 30th of October, five members of the Yeovil Amateur Club will be bringing amateur radio to a group of 14 year olds at the Kilve Court Space Science Course near Bridgewater in Somerset. The Special Event Station GB2KSS will be on HF and VHF during this course to give some of the youngsters hands on experience of amateur radio.

And now the solar factual data:

The period 5th to 11th October saw an improvement in HF band conditions and a modest rise in solar activity. There were 2 flares reported, an M1.4/SN on the 5th and a M3.1/1B on the 7th. A small magnetic storm was reported on the 9th but little came of it. Spot counts have increased and meaned about the 130s though the 6th was up to 166. Solar flux levels slightly declined over the period and averaged 124 units, dropping from 137 on the 6th down to 111 by the 11th, Nevertheless this is an improvement over previous weeks. The geomagnetic Ap indices were quiet up to the 9th when a sudden small magnetic storm took the levels to very unsettled, with an Ap index of 26, the period averaged 12.8 units. The state has been nil, nothing to report, throughout the period, except for the 9th. The radio quality indices rose to well above normal, being extremely good on all circuits, with the Tokyo and Canberra circuits being up to excellent at times. Levels declined on the 10th back to normal. The geomagnetic aa indices for the 29th September to the 5th October, as supplied by the British Geological Survey, declined from substorm levels of 78.7 nanoTeslas on the 29th, down to very quiet levels of 8.3 nanoTeslas by the 5th October. The daily indices averaged 31.5 nanoTeslas for the period.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 9.3MHz with levels reaching 11.3MHz on the 9th. This is the highest level since last April. The increase is partly due to the seasonal changes now taking place. The darkness hour lows averaged 2.7MHz and hardly changed day to day with the lowest levels being around 05.00 hours and the highs between 11.00 to 14.00 hours.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Sverdlodvsk:-(pronounced SVAIRD-LOVSK) averaged 8.2MHz, and the darkness hour lows 3.1MHz. The aa indices given in GB2RS are derived from data from Hartland UK and Canberra Australia. These stations were chosen because they are at conjugate points, which are each end of the same line of the earth's magnetic field. This gives a good guide to the planetary conditions.

And lastly the solar forecast:

This week, the more active side of the sun will be coming into view. Solar flux levels are expected to be at about the 110s. Geomagnetic levels are expected to be quiet and ionospheric conditions good. Daytime MUFs should be up to 30MHz, and darkness hour lows 18MHz, with 14MHz being best for darkness hours east/west circuits.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S N and G7 N U series, and Novice calls in the 2 0 A D and 2 1 B D series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Really? How did you determine that it was Windows 3.0, and not just a program that just made a window like interface? And what made you assume that it

runs under a PC? I have ZIP and UNZIP that run under unix. Just being
"a packet terminal program" is a pretty wide charter to run under.

Paul did a very nice job of describing the program in his response to my query.
It's a shame that your posting did nothing to further our knowledge of his
program.

73,

Chuck Harris - WA3UQV
chuck@eng.umd.edu

Ps. Sorry about the "broken" posting just befort this one, our system's
response time was going O(infinite), and it crashed while I was editing
the letter. Nice of it to post it though?

I have a KPC-2 that has run continuosly 24 hours a day, 365 days a year
for over 5 years. Never had a failure and never locked up in transmit.

When this rumor first came out, I did some testing and found that if I
transmitted with over 100 watts with the antenna sitting on the desk next
to the KPC-2, I could in fact force a lock-up. But under normal conditions
I think it is highly unlikely.

If you are having this problem, I think you should be searching in other
directions. Like excessive RF in the shack.

I'm interested in running KA9Q's TCP-IP software with a BayCom type modem,
basically just a TCM3105. What do I have to change in the NOS software
(i.e. in the AUTOEXEC.NET file or others) so as to have it run entirely
as normal with the "AX25" driver. I got the driver off an ftp site, I

believe it's the latest version out.

Thanks in advance,

73, Brit

Hello,
I am seeking help info in setting up my NOS switch to act as an NNTP server.
I am running KA9Q NOS (pa0gri v2.0h) on an ampr.org tcpip network. The docs
that I have only refer to setting up as a client but not a server. I dont
have direct access to the Internet/Usenet and am not even sure if NNTP is
the best way to go for offering Usenet groups to a handful of ampr.org
ops, as I havent ever seen it in action. Any help would be appreciated,
thanks in advance.

does anyone know if this problem also exists with the Kantronics All Mode
(KAM)? I'd hate to think that it could suddenly get locked into transmit
mode....even ignoring the (not exactly minor) legal issues, and the (again,
not exactly minor) issue of severe QRM, the simple fact that it could
cause a meltdown of what has always been a very solid 2m packet rig and
power amp is enough to worry me...add the legal and QRM issues, and it
gets even worse!!!

if this problem does exist with the KAM, can someone suggest to me exactly
how I might build in a timer to prevent such problems? is it as simple
as setting up a simple 555 timer circuit (say, set to trigger after a full
minute of being in transmit mode) on the T/R control to the rig that would
be reset by dropping out of transmit mode? or are there any other issues
I should be concerned with? anyone have a schematic for such a circuit
handy, so I can avoid re-inventing the wheel (even though it's a rather
simple circuit to begin with)? :-) anyone know how resistant the 555
timer chip is to RFI problems? it's been a long time since I dealt with
these buggers in class, so I could be missing something obvious and
stupid....

I just purchased at auction a pair of Motorola modems, each
labled:

RPM 840-C11 Radio Packet Modem.

Anyone know what these do or how to use them? They have
rechargeable NiCad packs and so, I presume, are intended for
mobile use...

Please email your reply to sphere@netcom.com as I rarely read this
group.

I am trying to use an "ALLOY" brand dumb terminal model PCST/G
to read the output of my PK-232. I can't, however, seem to get into the
"setup" mode of this thing. the ctrl-s, alt-s, etc don't seem to get me there
and I don't have a manual. Anybody out there know this terminal or have
a guess? Thanks.

Summary: Anyone tried it?

I've been thinking about getting back into amateur radio (I got my first
license, KA9JHH, when I was 12 but let it expire...), and I'm really
interested in packet though I honestly haven't learned much about it yet.

Right now, I'm looking into the hardware requirements. I just purchased
my very own IBM-type PC, and I'll be running Linux (FreeWare UN*X clone,
see comp.os.linux) on it complete with TCP/IP. I'd *love* to set up a
packet radio connection to the 44-net, but alas... I'm *cheap*.

Ramsey Electronics Inc. (793 Canning Pkwy, Victor, NY 14564) sells what
they call a "packet radio kit". I think it's only a modem... am I right?
Does anyone know what kind of connections go from this modem to the rig?

Are there any packet operators here in the greater-Milwaukee area?

How much power will my transceiver need to reach you guys???
(Just a general idea would be nice. I know conditions vary.)

I have an Icom W2A HT and a BayCom modem hooked up to my Toshiba T2000
laptop as follows:

I can receive packet pretty well (except when noise from the laptop
interferes). The problem is that the T2000 & BayCom won't transmit.
That is, the Icom mike is never keyed.

Questions:

- Is this the correct way to hookup a W2A to my BayCom? The W2A manual
  does not document the connections on the speaker/mike phone jack
  connector, but since I know which one is ground, and which one is
  speaker, the other one *is* the mike, right?

- Is .1uf the correct value for the capacitor? I've seen conflicting
  advice for what value to use.

- How does the PTT on the Icom work without a seperate PTT line?

Thanks for any help!

Johan (or others)...

has anyone ever used the Buckmaster code in NET? I am looking for the code to be able get incorporated into NET for the Mac. Adam-PA2AGA does not have access to the HamCall info... so he doesn't know how to modify the existing code.

If I could get hte code from someone... maybe we can add this to the Mac version.

The VERY latest version is 1.1.8a. The only difference from 1.1.8 is that there was a patch to KISS which only would affect satellite users.

The firmware is on CompuServe and the WA6RDH BBS, plus available from the TAPR office (P. O. Box 12925, Tucson, AZ 85749) Programmed EPROM plus a 100 page command booklet is $12.00, postage included.

I don't know why there would be a problem in a TNC-200. Have you upgraded to 32K memory?

I have been putting the PA2AGA version of net/mac (now at rev 2.3.9) on ucsd.edu. Look in the directory /hamradio/packet/tcpip/pa2aga or /hamradio/packet/tcpip/incoming. Ivo's mailer, IM/Mac should also be in there.

If you can't get it by FTP let me know and we can arrange something.

I need help in interfacing the TAPR 9600 baud modem to Kenwood TM431 440MHz band mobile rig.

While I have successfully connected the transmit side, I am having difficulty with the receive side. The second IF oscillator, mixer, demodulator and squelch circuits are on a small pc board, about 1" by 2" labelled Kenwood KCD01 and is soldered in edge wise as a SIP IC. In fact, kenwood calls it IC1 (part KCD01). This board has been dipped in black epoxy so that no traces are visible. The components, all surface mount, are visible as bumps under the black epoxy. The only distinguishable component is a TK10487M (presumably FM IF/Demod) IC. The service manual does not include the schematic nor the foil pattern of this board. I need to get un-filtered "raw" audio for the modem. To further add to my woes, TK10487 is not listed in the IC master books. So...

I would really appreciate hearing from you if you have gotten TM431 or a similar rig with KCD01 to work with 9600 baud packet.

I would also like to hear from you if you know which pin of TK10487M is the audio out pin.

Thanks in advance.

I need to update an old Baudot feed to an Ascii rs-232 feed but cannot find a way to do this.. The hardware on the system can only receive 5 level bautot but the information will only be available in the near future by modem. I can put a PC in place to receive the data but need info on conversion on the pc for output to this very old hardware.

Software would be the answer but just info on Baudot would be of an assistance as I cannot find much on the code.

Many thanks

Bill.

I think it probably is of general interest to remind everyone that Doug
Thom, N6OYU, is the distributor of all pre-PA2AGA versions of NET/Mac.
He may have a version that will run on your system. I use a version from
April, 1989 that takes only 220K of disk space and needs only 350K to run.
I run it on my Mac Plus (1MB RAM) along with Bdale's Mailer and TeachText.
Haven't tried it on non-HFS disks.

Doug's address is 1405 Graywood Dr., San Jose, CA 95129. Telephone is
(408) 253-1306. You can also try reaching him at thom.d@applelink.apple.com.

Does anyone know what the modifications are to make a TS-450
work on the MARS/CAP (esentially "out-of-band" operation)? What
are they?

Thanks--jd

NETROM

Subject: How to CHANGE the CALLSIGN in the NETROM Software

THIS MOD IS NOT TO BE USED FOR PIRATING THE PRODUCT OF SOFTWARE 2000
OR ANY COPYRIGHT PRODUCT OR MATERIAL.

A bit of History...

   When NETROM was first announced, most of the packet community realized that it was another significant contribution to the growth of packet radio. Contributions from the WA7MBL and W0RLI authors, the hundreds of digipeater owners, sysops of countless PBBS's and "packeteers" who have DONATED their time and efforts to packet, have been the backbone of packet growth.

   Despite the many complaints from many amateurs over the cost of the NETROM "contribution", Digipeater owners once again dug deep into their pockets and DONATED their efforts to the cause of Packet Amateur Radio and NETROM Nodes have been appearing everywhere.

   Now with the emerging controversy over Nord-Link's "THENET" (a NETROM "look-alike" being distributed FREE with source code for the Amateur community to modify and improve), Mike Bush and Ron Weekes of Software 2000 (owners of NETROM) have made harsh comments of theivery, etc.. towards Nord-Link for their efforts. Amateurs who have viewed the code are questioning the validity of such comments by Software 2000.
CONTINUED IN FILE NETROM.1
NETROM.1
   As a "packeteer" and a PBBS sysop, I can only view these comments as

"wimpering" over the possible loss to the "padding of their pockets" Something I feel Amateur Packet should NOT be about! Software 2000 HAS made a worthy addition to the world of packet, and they are deserving of credit in that aspect, but with the current cost of the initial NETROM software, PLUS the fact that a callsign change requires another COMPLETE purchase of that software, and now this "blubbering and name-calling" over Nord-Links release of "THENET", I can only conclude that Software 2000 is not interested in the "advancement of the art and science of Amateur Radio" as much as they are interested in the "advancement of the size of their wallet".

If all of the fore-mentioned contributors (i.e. PBBS authors, digi owners, sysops, etc...) had this attitude, the packet network we ALL enjoy today would not exist! Luckily, we still have hams who hold the advancement of the art and the enjoyment of amateur radio above the almighty dollar.

The following file was passed to me recently, and "In the spirit of Amateur Packet Radio and for the advancement of the Art and Science" I am passing this on for widest possible distribution. I ask only that this file be distributed in its entirety to preserve its intent.

Mark Marston KA1NNN Sysop CoCoPBBS

Remove the code from the following areas by setting values in these areas to Hex $00.

	Address			(PC Tools Reference)
Hex:	$ 0786	to	$ 0797	Location 3 Lines 390 - 407
	$ 2629	to	$ 263A	Location 19 Lines 41 - 58
	$ 3A75	to	$ 3A86	Location 29 Lines 117 - 134
	$ 4BAF	to	$ 4BBC	Location 37 Lines 431 - 444

Insert the following 18 bytes into location starting at $ 0786
(PC Tools Reference: Location 3 Line 390)

	Address	Insert		(PC Tools Reference: Location 3)
Hex:	$ 0786	$ 21		Line 390
	$ 0787	$ xx	<-- 1st Letter of Callsign in ASCII Hex	Line 391
	$ 0788	$ xx	<-- 2nd Letter of Callsign in ASCII Hex	Line 392
	$ 0789	$ 22		Line 393
	$ 078A	$ 30		Line 394
	$ 078B	$ 82		Line 395
	$ 078C	$ 21		Line 396
	$ 078D	$ xx	<-- 3rd Letter of Callsign in ASCII Hex	Line 397
	$ 078E	$ xx	<-- 4th Letter of Callsign in ASCII Hex	Line 398
	$ 078F	$ 22		Line 399
	$ 0790	$ 32		Line 400
	$ 0791	$ 82		Line 401
	$ 0792	$ 21		Line 402
	$ 0793	$ xx	<-- 5th Letter of Callsign in ASCII Hex	Line 403
	$ 0794	$ xx	<-- 6th Letter of Callsign in ASCII Hex	Line 404
	$ 0795	$ 22		Line 405
	$ 0796	$ 34		Line 406
	$ 0797	$ 82		Line 407

If the Callsign is less than 6 characters, pad the remaining characters with spaces which is a Hex $20.

Insert the following 5 bytes starting at Location $ 4BAF
(PC Tools Reference: Location 37 Line 431)

	Address	Insert	(PC Tools Reference: Location 37)
Hex:	$ 4BAF	$ 3E	Line 431
	$ 4BB0	$ xx <-- SSID Code (Explained Below)	Line 432
	$ 4BB1	$ 32	Line 433
	$ 4BB2	$ 36	Line 434
	$ 4BB3	$ 82	Line 435

Place the Hex value for the desired SSID in Location $ 4BB0
from the chart below: (PC Tools Reference: Location 37 Line 432)

SSID	Hex Value
0	$ 60
1	$ 62
2	$ 64
3	$ 66
4	$ 68
5	$ 6A
6	$ 6C
7	$ 6E
8	$ 70
9	$ 72
10	$ 74
11	$ 76
12	$ 78
13	$ 7A
14	$ 7C
15	$ 7E

This completes the modification for the change of NETROM callsign.
73's KA1NNN

Interfacing randheld-rig to a TNC or a BayCom modem seems to be
a story, which could fill thick books.
For the usual Baycom-modem (at least for the original circuitry),
no external capacitor for DC-decoupling is required. The modem contains
this capacitor inside.
In most cases, a resistor in the range 2.2 - 6.8 kOhm suits best to switch
the PTT.
Take care with some Alinco-rig, a stereo-jack is required because +5V
is an additional pin on the mic-connector. This is connected to GND by
plugging the usual mono-jack in.

| I can receive packet pretty well (except when noise from the laptop
| interferes). The problem is that the T2000 & BayCom won't transmit.
| That is, the Icom mike is never keyed.

Try 0.01 uF and about 10k.

| - How does the PTT on the Icom work without a seperate PTT line?

By the circuit sensing current drawn from the MIC/PTT line. Too high a
resistor, and it never keys. Too low a resistor, and your audio gets
shunted away. Too high a capacitor, and you get some interesting
time-constant effects. Too low a capacitor, and you don't get enough
audio coupling. The transformer solution is much better, but I've

never tried it on Icom gear.

Oh, and turn off your battery saver as well.

I guess this belongs in r.r.a.policy but since the discussion has been mainly
in this group, here goes ..

How to provide usenet/email <-> packet gateway.

Use a BBS to get Usenet NEWS and private email. This BBS has nothing to do

with ham radio except that the SYSOP has a Ham License. The BBS just happens to have a multi-connect AX.25 port on it. No IP access - TTY only, just as you would connect using the PSTN. Now, if any Ham wishes to have email or News he simply logs into the BBS and registers (like any other user) and asks the syso for email permission. AX25 is used only as terminal service. Not as sexy as protocol access - sure, but it does work, is being done, and doesn't have many political problems.

I have hooked up my 850 to an AEA PK232 for direct FSK. It worked well after I switched the key down tone to a mark from a space. This is easily done on the Kenwood 850 by changing an EPROM parameter. The KAM should be similar.

I am working on a project that involves communication from a base computer to a remote autonomous helicopter. I am looking into either building or getting my hands on a very reliable data link that will allow two way communication from base to remote vehicle. We have worked on a system that uses a high frequency tv transmitter to transmit converted digital data. We have also worked with LAWN's (local area wireless networks.) These two approaches are not effective enough in our situation.

I was wondering if anyone knew about a more powerful system than the LAWNs, but has the capability of rs232 communication across a data link.

I would gladly consider any alternatives!!

Thanks for the help.

Hugo;

I am not sure where you are located. If you have the 3.51 version
and you do not have docs, you should be able to get a shareware
copy for only cost of copying. There is a California address
that makes copies. I could make a disk copy if no one else
would, but I would require $5.00 to do it. If you are in
Europe, there has to be somewhere in England or Germany who
has the English version if you can not read German. If you

ask around over there, you should be able to find it. If
you know the Digicom/64 authors, and you are in Europe,
contact them.

I have had Digicom/64 since the Spring of 1987. I started
with version 2.00, upgraded to another version I fail to
remember and have been with version 3.51A for better than a
year. It works so well, I see no need for improvements.
There was a SABM bug fixed from version 3.51 on the 3.51A
version. I homebrewed my interface which I do not
recommend if you do not need to. I have an internal
power supply protected by 130-volt AC Varistors on the AC input.
I have 130-volt Varistors behind fuses (very important if
you do not like explosions when one type of varistor fails) and
never have to do any lightning repair due to AC line
transients. I also bond my AC neutral to three parallel
earth grounds at my service entrance. That might not
be legal in some places. It can increase RFI problems
but keeps lightning damage to a minimum.

Good morning. It's Sunday the 11th of October and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

This week we have news of the Funeral of "Dud" Charman, G6CJ; a New Council Member for Zone C; appointment of an Honorary Officer, some Special Jamboree on the Air stations, microwave enthusiasts; plus all the usual DX, contest, rally, propagation and club news.

With the death and funeral of Frederick J. H. (Dud) Charman, BEM, G6CJ, the Society and the Amateur Radio movement have lost a unique character, who contributed greatly to the hobby in the early and in-between years. Council Member John Forward, G3HTA attended the funeral on behalf of the Radio Society

of Great Britain. A full obituary on the life and work of Dud Charman, G6CJ will appear soon in Radio Communication.

At the RSGB's Council Meeting held last month the decision that Neil Lasher, G6HIU, be invited by Council to be a co-opted member for Zone C under Article 27 of the Articles of Association was agreed. This took effect from the 25th of September.

News now of the appointment of John Irving, G4XJT as the Honorary Officer for the position of Emergency Communications Officer. He will take up the position with immediate effect, but for the moment all communication is to be passed via the Chairman of the RSGB Membership Liaison Committee, Clive Trotman, GW4YKL, whose address is correct in the RSGB Call Book. Further details of the address and telephone number for John Irving will be released as soon as they become available.

Next weekend is the 35th Scout Jamboree on the Air, which this year has the theme " Let's Talk". Last minute details and information about the event can be obtained by telephoning the JOTA hotline on 071 581 9920 from Monday the 12th of October onwards. Special stations that will be taking part this year include GB2TWB Tower World Blackpool, at the top of Blackpool Tower and GB2BT at the top of BT Tower, London. This is part of a link-up between Scouts at Towers around the world which are members of the World Federation of Great Towers. Please remember that the aim of the event is to enable Scouts and Guides to talk to and find out about each other. They should be given every encouragement to do this within the rules of the licence.

The next RSGB Microwave Round Table meeting has been arranged for Sunday the 18th of October. This meeting is the scheduled Autumn event of the Southern series.The venue is the Flight Refuelling Amateur Radio Society Club, Wimborne, Dorset, which is signposted from the Wimborne by-pass. The meeting will start between 10.00 and 10.30am. It will feature an open forum; items under construction and complete stations; a bring and buy sale; a calibration and alignment session, and a short presentation. Further details can be obtained by telephoning Ted Jewell, G4ELM, on 0730 892462

Now for some repeater news;

We apologise to the GB3DS Repeater group who were incorrectly listed in the October RadCom article on repeaters as having completed the documentation but not paid the franchise. The payment was received by the accounts section at RSGB Headquarters in June but was not notified to the repeater person for issue of the franchise letter.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Canada, the Listowel District Secondary School Amateur Radio Club will sign as VD325E from Saturday the 17th until Friday the 30th of October. This to celebrate the 25th anniversary of Elma Township Public School. From Fernando de Noronha, PP1CZ will sign PY0F/PP1CZ from Saturday the 17th until Saturday the 31st of October. From Antigua, JP1NWZ and JL1MUT will sign V2/home call from 21st to the 28th of

October. They will be active on 160 to 10 metre bands including the WARC, using CW and SSB. From Ascension Island, N6TJ will be active as ZD8Z from Tuesday the 13th to Wednesday the 28th of October.

Rally news now, and we know of three events for today Sunday the 11th.

The Armagh and Dungannon and District Amateur Radio Society Rally is being held at the Gosford House Hotel, Markethill, County Armagh. Doors open at 12.00 noon. The event features the usual traders, a bring and buy and refreshments will be available. Talk-in is on channel S22. The Hornsea Amateur Radio Club Rally is being held at the Floral Hall, Hornsea, North Humberside. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy. The South Devon Radio Club's 'Computercation 92' Computer and Radio Rally is being held at the Hillhead Camp Site, Dartmouth Road, Brixham, Devon. Doors open at 10.00am and the event features trade stands, car boot sale and refreshments. Talk-in will be on channel S22 via GB4CPU. There are no scheduled rally events that we know of for next weekend Saturday the 17th and Sunday the 18th of October.

HF Contest news now:

During today Sunday the 11th, the RSGB's 21/28MHz Telephony Contest is taking place from 0700 until 1900GMT. During next Sunday the 18th the RSGB's 21MHz CW Contest will take place between 0700 and 1900GMT. See April RadCom page 66 for further details.

Next the VHF/UHF Contest news:

The next RSGB UHF event is the 432MHz Cumulatives for Wednesday the 14th of October. It runs from 1930 to 2200GMT. This is the first of five to be held in the next three months. See June RadCom page 65 for further details. The next RSGB VHF event is the 144MHz CW Cumulative for Friday the 16th of October. It runs from 1930 to 2200GMT and June RadCom has further details.

Special events

During next weekend the Scottish Tourist Board Radio Amateur Expedition Group, will use the callsign GB2STB from Airdrie Town Hall, Airdrie.This is to mark the Launch of Airdrie Mod 93, the 101st International Gaelic Festival. All the Special Event locations operated from by the Group are open to the Public. Contact with the stations taking part will count towards a Certificate and Trophies Awards. For further information contact GM3MTH, by telephoning 0236 440495

And now the solar factual data:

The period 28th September to the 4th October saw considerable magnetic disturbance due to the passage of a coronal hole, there was no flare activity. Very poor ionospheric conditions resulted and were only just recovering by the

time this bulletin was being prepared. Sun spot counts meaned at 136 though they ranged from 93 up to 179 over the period. Solar flux levels averaged 118 units and did not vary much day to day. The geomagnetic Ap indices reached magstorm levels at Wingst on the 28th at 12.03 GMT, and by the 29th storm levels of Ap 57 units were recorded. Conditions remained very unsettled up to the 2nd October, when the levels then declined to quiet. The period averaged 22.7 units. The state has been no flares and no protons just a magnetic storm. There was a classic pre auroral enhancement of the HF bands leading up to the 28th, then the radio quality indices collapsed to extremely low levels on all circuits by the 29th, and were only beginning to improve by the 4th. The aa indices as supplied by the British Geological Survey for the period 22nd to 28th September were quiet, with the daily averages for the period being 17.5 nanoTeslas only equal to K3. The mean sunspot count for September was 62.9 with the maximum of 86 on the 24th and 27th. and the minimum of 38 on the 8th. The smoothed count for March 1992 is 108 +/- 5, with the forecast for September 1992 being 94 +/- 15. The Orionids meteor shower starts October 16th but reaches its peak on the 22nd.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough as reported by Appleton averaged 7.3MHz but dropped to only 5.5MHz on the 29th, and though levels were recovering by the 4th October, only 7.7MHz was recorded. The darkness hour lows averaged 2.1MHz and did not vary much day to day, with the low levels now being around 05.00 hours most days.

Now the ionospheric data for the north:

The F2 critical frequencies are not available from Irkutsk any more, so we will be using the Sverdlodvsk:- (pronounced SVAIRD-LOVSK) :- data which is situated at North 56 and east 61 degrees, The daytime levels averaged 6.8MHz and the darkness hour lows 2.4MHz. With satellites and fibre optic cables, taking over communication circuits, interest in the ionosphere is now very low. One reason why observatories like Irkutsk are dropping out. Its only amateurs and shortwave broadcasters that are interested in the ionosphere these days.

And lastly the solar forecast:

This week, the quiet side of the sun will be coming into view, solar flux levels are expected to be about the 110s. Magnetic activity is expected to be quiet. Ionospheric MUFs during daylight are expected to reach 24MHz, though conditions could improve towards the end of the week when 28MHz may be open for north/south paths. The darkness hours are expected to reach 18MHz, with 14MHz being best for east/west contacts.

And that's the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S M and G7 N T series, and Novice calls in the 2 0 A D
and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society
of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Yup, it's me again ... this time, with ... a new old toy!! :-)

Found this guy, the KPC-1, at a flea fest, (yep, another one), and picked it up for the proverbial song. (The PKT-1 ain't workin' yet ... What did I have to lose?) No manuals, no docs, no power supply, (but that's no biggie), no nothing but the TNC box for $20. How could I pass it up???? Anywayhow ... Does anyone know anything at all about this creature? Features, drawbacks, compatibility, upgradible-ness, where can I get documentation? Actually, I hear that Kantronics provides documentation on MS-0DOS floppies for some of their TNC's. If so, how can I get it? Or if anyone has it, can I have it puh-lease??? :-) I hope this one works--the guy here told me the same thing the guy who I bought the PKT-1 from: "Well, I ain't never made a contact on the air with it but it talks to the computer ..." Maybe better luck this time? It's a lot smaller, so I betcha I keep it--unless someone says the other one is better. Dunno.

Any and all info muchly appreciated!!!! :-)

  Have people tried using 1200 baud BPSK modems on 10 meters? (the
modems they use for pacsats) If its legal we better take advantage of the
superior performance that binary phase shift keying offers before they try
and ban packet.

I am seriously considering getting involved in 9600 baud packet radio and I
am seeking the advise and wisdom of other wireless pioneers. (on the
wired internet). What experience has there been of hooking packet tnc's
directly into multiuser computer systems? Obviously the computer would
have to running in a half duplex mode on the tnc ports. Does this require
special host modes on the tnc? What has peoples experience been with the
more sophisticated TCP/IP protocols on 1200 baud packet? Ideally I would
like to be able to run a Telnet emulation on a 9600 baud tnc that could be
set for single user access with only a small amount of network traffic.

According to my radio shack technician license book 9600 baud operation
is legal on 6 meters as long as your emission is kept at 20 khz of
bandwidth. This would seem to be the perfect band to build full duplex
packet repeaters! We could have interactive logins and internet access
from hundreds of miles away!!

 To quote John Lennon. "There is nothing that's been done that can't be
done", because if you go ahead and do something they can't say you can't
do it because you have already done it! Though at this time I would not
advocate singing in non digital form.

I just finished putting together a Baycom-type modem on a breadboard

using a TCM3105. I hooked it up to a 386 and an Icom IC-228H but
I'm only getting about 3.6V to power the modem, I'm not sure if the
serial port is actually being controlled by the Baycom program at all.
I tried switching the program between COM1 and COM2 but nothing changes.
I have been able to connect to myself though, if that means anything,
but it won't transmit or receive anything to or from anyone else.
Voltages on the serial port pins seem to never change.

Has anyone had any problems like this one or could anyone help me out
with this?

By the way, it's Baycom 1.4, and also I made sure there was no mouse
driver or anything of the sort running at the same time.

Thanks in advance,
Brit

I use MSYS 1.13 in BBS service with forwarding in several directions. The
doc file explains it fairly good, but I would be happy to get you started.
You can carry this to E-Mail if you like. I travel some so allow time for
the messages to traverse.

I'm the one who posted about trouble with a Baycom modem.
I hooked it up to another PC and it seems to be working, or
at least mostly, don't know why it didn't work before though.

Now it transmits, I monitored the audio with an HT, but I don't
know if it's receiving. Is there a way of seeing everything
that the radio receives, instad of what is addressed to or from
me only? I'm using Baycom 1.4.

Thanks again,
73 Brit

Two major problem areas. The unit has no hardware time out timer. It
can lock up and melt down your radio. (Sad experience) Don't plan on
using it unattended without an outboard PTT timer. Second, it uses
software DCD. It falses on noise *a lot*, you must run a squelched
radio. Naturally it's not software or hardware compatible with TAPR
TNC2s. That means no nifty ROM upgrades or high speed modems. Other
than that, it's an ok little box.

>   listing of Beacons!! Sheesh.)

     I think they should drop it if they can't handle it. Then again they
     should get rid of the beacon list and all of the other non repeater
     info. But why don't they do this? Because it would make the publication
     smaller and then they can't sell it for $6.00 therefore they would
     not be making the profit by selling a directory that hardly changed
     at all since the last directory. Imagine if they had only the repeater
     info in there I would only buy a book once and never buy it again
     because it wouldn't be worth buying since it didn't change much in
     4 or 5 years get it? Its all a ARRL scam to produce a half-assed
     directory with other bells and whistles with pages then last years
     so it looks like things are happening for the advertisers. Too bad
     the info is so outdated and wrong because it can't keep up with

the new technology out there. I'll never buy an repeater directory again from ARRL until they catch up with the responsabilities.

Whats the other repeater directories name that was mentioned out there with the "provate" repeater info?

I have a modem built around a TCM3105 connected to a 386 running Baycom 1.4,
I followed the schematics in tcm3105.ps that I got from an ftp site.
There is one problem: pin 7 (RXB) on the TCM3105 is connected to the tap
on a 50Kohm pot, the pot is connected between Vcc and ground. Varying the
pot chages the wave of the data sent to the computer by the TCM3105, (I'm
not sure how to describe the difference technically, but) it goes from
predominantly "high" to predominantly "low" (as if I were changing the
time constant of a capacitor circuit in there somewhere, or something of
the sort). How can I calibrate the pot to the right position? I suppose
there is only one point where the data received will make any sense to the
computer.

Thanks for any help,
73 de Brit

>puh-lease??? :-)

Old box. The KPC-1 is upgradable to Kantronics's current firmware
level, but it may require a minor modification. I believe the problem
is in size of Static RAM originally installed.

As Gary said, the KPC-1 does not have a watchdog timer. However, I
have never had any trouble with my KPC-2 or my KAM keying up and
burning out a radio. Nor have any of the other 20 Kantronics users
that I know. (I think we have had this discussion before :-))

Kantronics does have a BBS, but I don't remember seeing any manuals on-
line or hearing about 'manuals on disk'. (though it is not a bad idea)

THE REAL SCAM is that is costs $$ to be in it as well as to buy it. While I
will agree that the ARRL is all we have lobbying for us in congress, they
could do a better job with a few things....

For those with the '92 (blue) directory make this addition to the IOWA pages
under central:

Ames WA0KHF   147.375 +   CARC   oae

And if you are near Ames, give us a shout!

>Have people tried using 1200 baud BPSK modems on 10 meters?

There were some articles on this in the May and September issues of QEX,
reprinted in the October 1991 issue of Packet Status Register. The
authors (W9UWE, KB6BT and K2RDX) report excellent performance as well as
monitoring operation from Japan, Philippines and Australia on 15 meters,
where 1200 baud operation is legel on that band.

He further suggests 9600 bps operation on 6 meters. In much of the
western US, there is a 4800 bps backbone which has been in operation for
several years on this band.

The ARRL compiles lists that are sent in by the recognized local repeater
coordinators. This is done once a year. In Northern California there are
over a hundred changes just to the voice repeater listings. About a 10 -
15 percent update.

Does one really need a directory to operate packet ?

I dont think so...

Nodes will tell you of Routes....

BBS s have files of info if you just look.

Northern Amateur Relay Council of California publishes a Local Repeater
Directory twice a year. Four Dollars postage paid. PO BOX 60531 Sunnyvale,
CA 94088-0531

What kind of digital activity should be published ?

Network Nodes   KaNodes BBS PacketCluster TCP.IP servers

in other words service providers....

Should the 5000 home digis in nor calif be published ? NOT

The frequencies and modes should be documented in the repeater directory, co-ordination gives legitimacy in disputes.

On another note, we need to adopt a "highest and best use" philosophy on co-ordination --- i.e. a public service club with large membership should get precedance for a repeater pair, before 2 people who want a private repeater to yak 10 minutes a day on the way to work whent hey could easily operate simplex, or use a shared repeater.

I did. My !@#$%^&! KPC-2 locked up in transmit -- it was over a day before I noticed. Fortunately the power supply failed first and acted as an (expensive) fuse for the radio.

I did some experimenting, and found that the KPC-2 occasionally locks

in transmit when power is first turned on. Evidently there was a
momentary power failure when I was not at home.

I had always assumed that there WAS a timer in the box. All the other
TNC's have them. Why doesn't Kantronics include a warning in the manual?

My KPC2 _once_ got stuck in transmit mode for a day or so. In my case, the
radio took it OK, and so did the power supply. This probably wiped out
activity on the freq in my area. But I only run 8 watts (about half gets
out of the 50 feet of RG58). Haven't had it happen again for a couple
years.

I just bought a Kantronics KPC-3 and tried to do
the battery mod. I discovered that the external
power jack was defective and when the external
power plug was not attached, the 9V battery
was not connected.... This happened on two
successive TNC's! Kantronics promises to
send me a new working jack. If anyone has
similar problems, they might call Kantronics
tech support. I would be curious to know
if anyone has successfully done the modification
or if all units have defective power jacks.

A friend of mine loaned me a few back copies of QEX this past week and I came
across something that I would like to find out more about. In the January 1992
edition there was an article titled "TAPR Deviation Meter Planned". In the
article Lyle Johnson, WA7GXD, described TAPR plans to build a microprocessor
based deviation meter with a built in 2 meter receiver for around a $100 in
kit form.

I would really like to find out what the status is on this project. For
example, how is the prototype work going, when will the kit be available and

how much has the kit cost projection grown. I pulled his address out of the Internet callserver and tried to call hime this evening with no luck as his phone number is unlisted.

If anyone knows anything about this project, I would like to hear an update...

Can someone suggest a good news reader that can be used in conjunction with NOS on a PC? I will be using PA0GRI NOS 911229 to contact the NNTP server and download news. I am simply looking for a good system to read and manage news with - i.e read news, expire articles, and prepare articles for posting.

Suggestions for news readers would be much appreciated.

Any tips on setting up news with Ka9Q NOS would also be helpful.

Thank you,

Ashok

In Packet-Radio Digest V92 #278, Bob Segrist, KD4PWU asked about the status of the TAPR Deviation Meter.

This project is still in work, but has been out-prioritied by some upgrades to the TAPR 9600 bps modem and Metcon-1. There have also been a few problems with the pll/synthesizer, so the completion has not been as uneventful as we would have wished.

At this time, I unfortunately cannot project a date that the kit would be

available. Soon, I hope. The price projection is unchanged, but when the design is complete, we will be able to definitize things. When we get there, we will let everyone know (PSR, CompuServe, Internet, ham magazines, etc.)

I wish there was more to report, but hang in there.

Bob

Subject: News/mail reader for DOS
Organization: Trumphurst Ltd.
Lines: 33
Date: Wed, 16 Sep 1992 18:32:41 +0000

Message-ID: <716694839snx@trmphrst.demon.co.uk>

[...]

The connection software is based on Phil Karn's excellent KA9Q program,
and the news reader is based on snews from John McCombs.

I did not particularly like the user interface of snews, so I wrote my own
combined newsreader and mailer. It is written in C++, and uses my own SAA
compliant text mode user interface toolkit.

If there are any other people out there who use DOS to access the news,
and they would like to try my news program, the latest version is
available for public ftp from :

ftp.demon.co.uk:/pub/trumphurst/cppnws16.zip

Later versions (with different numbers) will also be made available in
that directory as they are released.

At present, the documentation is contained solely in the on-line help
file. Also, cppnews requires the unbatch, expire, addgroup and rmgroup
programs from the snews distribution.

Several shuttle missions and the MIR space station have had 'packet radio'
onboard,
I don't think any of them have run IP (maybe some of the OSCAR Satellites?) yet
---
however, I don't think the domain has been resolved, though any amateur operation
is probably on net 44 (amprnet --- Amateur Packet Radio Net) and domain ampr.org.

KA9Q's implementation handles fairly-large-latency connections now.

   Does anyone have the pinouts for the speaker and mic jacks on the
Alinco DJ-F1T? I have to make up a cable to interface it to a
Heathkit TNC-1.

   Is the push-to-talk a simple connection to ground or voltage,
or is this one of those impedance changing circuits that are so
popular among the handhelds?   How do you wire these?

   Also, does the TNC-1 have a watchdog timer on the PTT line?

Thanks much,

AAAAAAKKKKK... Wrong answer. Thank you for playing.

What about the "private" repeater group with several hundred members?
Is this really fair to those several hundred as opposed to the "club"
with several hundred members who run a "public" repeater?

I think not.

Brit, I also tried to use the Baycom software with a TCM3105 modem on
my Goldstar 386sx machine, and couldn't get it to work... I don't think
that it was talking to the serial hardware on my clone correctly.
There is a disclaimer file with the Baycom software which explains in
weakly translated english that there are a number of serial port hardware
configurations that will not work with Baycom. the Baycom sources are
also not available, so I gave up on Baycom. My Ramsey packet modem kit
(am I going to say something good about Ramsey? :-) came with an alternate
wiring scheme for the Poor Man's Packet software which uses the parallel
port instead. This is what I am using. The PMP wiring basically skips
the CMOS RS232 level converter chip (74HC04?) and runs the parallel port
TTL level lines almost directly into the TCM3105 chip. I can send you
the schematic if you want it, or you can look up the original PMP
articles.

Hi all,
I currently have my Amiga 500 configured as a host on our local Packet Radio Tcp/ip network. Next quarter, a friend of mine also with an Amiga 500 will be moving in next door. Since I have two working serial ports, I would like to have one line running slip to my neighbours Amiga500 for remote file access and the other line connected to the tnc and two meter radio.

My friend is not licensed as an Amateur Radio Operator so I am a little bit worried about keeping isolating his host from other ip users on our packet network. How can I configure my host to prohibit gatewaying across my machine?

Thanks for any pointers..

Organization: American Radio Relay League
Lines: 59

We're trying out a new service. We've made available a number of
text files containing information about various facets of Amateur
Radio. You can retrieve these files selectively by sending an
email message to ARRL HQ. Each file you request is then mailed to
you automatically, usually within a few hours.

Here are copies of the current "help" and "index" responses of
the info mail server. They should get you started. Enjoy!
==
INFO is a service of ARRL HQ. To use it, mail messages to:
   info@arrl.org
Each line of the message should contain a command as shown below.
You may place as many commands in a message as you want. Each file
you request will be sent to you in a separate message. Only ASCII
text files are supported at present.

Valid INFO commands:

help   Sends this help file
index   Sends an index of the files available from INFO
send file   Sends the specified file
quit   Terminates the transaction (use this is you have
                 a signature or other text at the end of the message.)

PktWin Version 1.2 is now ready.

I have uploaded PktWin to ftp.cica.indiana.edu. It is currently in /pub/pc/win3/uploads as PKTWIN01.ZIP.

It is an Amateur Radio Packet TNC controller program, and is shareware (25 pounds registration).

Hi,

I'm just getting started in packet radio and need someone to point me
in the right direction to get a ham TCP/IP address. The only info
I have thusfar is a name and call in "Gateway to Packet Radio." Seems
this should be an appropriate forum for this question.

Thanks,

Steve, WD5HCY

>years.

There is a lot of activity on 145.01 in our area, including a very popular
high level digipeater located near Big Bear Lake (AA6TN-1, BGBEAR). Well,
a while back BGBEAR stopped working. Terry Neal, AA6TN, drove from Costa
Mesa to to Big Bear to figure out why his digi was broken. He discovered
that his digipeater was working fine, but that a station in Big Bear had
wedged in transmit mode and the station operator was out of town. It took
a couple more days to get the wedged station back into legal operation. This
station was running moderate power in a location sheltered from most other
stations but full quieting into a high level digipeater; the interference
caused was severe. Of course, it turns out the station was using a KPC-2.

Without personally insulting anyone, I personally feel it is irresponsible
to operate an unattended station without the use of a watchdog timer. I
would highly suggest that owners of KPC-2s invest the effort to build a
an external watchdog timer, or call up Kantronics and ask for one.

Thanks to all ye who helped me out with the BayCom questions I posted!

Apparently I got a hold of an old copy of the schematics for the TCM3105 modem. There was a small error which was corrected about a year or two ago, but it seems there are still old versions hanging around the net.

I must say it's very nice when the authors send helping email right after I posted the questions.

Congratulations to the BayCom team!

PLEASE POST EVERYWHERE !!!!!!! Reposted with corrected directions
                                & additional details.

The Radio Amateur Telecommunications Society (RATS) is proud to host the

       11th ARRL Amateur Radio Computer Networking Conference

         to be held on Saturday, the 7th of November 1992

      at Fairleigh Dickinson University, Teaneck, New Jersey.

The conference will feature both advanced and beginner's talks by many of the leading contributors to the Amateur Radio digital community.

The Conference schedule of events for November 7th includes the main Conference presentations, beginner's sessions and demonstrations starting at 8:30 AM and continuing until 5 PM. A hero lunch will be provided by CQ Magazine. Admission to the Conference is $30.00 and includes admission to these other interesting events:

Friday, 6 November

The ARRL Education Department is sponsoring a Digital Signal Processing (DSP) Course from 9 AM until 5 PM at the Conference hotel (see below). This exciting course will be given by Jon Bloom, KE3Z ARRL Senior Engineer. Contact Rosalie White at the ARRL Education Department (+1.203.666.1541) for details.

Conference registration begins at 5 PM at the Best Western Oritani Motor Inn, Hackensack, New Jersey. The hotel is across New Jersey Route 4 from the University. Call in advance for reservations at the Conference rate of $55.00 per night. The hotel telephone number is +1.201.488.8900.

Friday evening will feature "Birds of a Feather" (BOF) sessions and demonstrations. To be sure there will be BOFs for the HF Forwarding, TCP/IP, ROSE, and TheNet folks, as well as for other communities of interest. Contact Gordon Beattie, N2DSY (+1.201.387.8896) if you would like to organize a BOF or need information. There will free refreshments and munchies for those attending the conference.

Saturday, 7 November

While the Conference activity proceeds at Fairleigh Dickinson University, your spouse, children and/or companion might wish to enjoy the shopping available at some the many shopping malls that have made Paramus, New Jersey famous as a "shopping mecca". The Riverside Square Mall is next door to the hotel (a few hundred feet) and most of the rest are within a mile or two of the hotel and University and are easily reached by car, bus or taxi.

After a day of Conference activity we will all return to the hotel for a pizza party. Note: This is now a sponsored event and will be FREE for conference attendees.

During the evening, several commercial Amateur Radio manufacturers including Pac-Comm Packet Radio Systems, Kantronics, HAL Communications, and others will present their products and answer questions.

A special feature of the evening is that many of these manufacturers' products will be available for sale. KJI Electronics (+1.201.239.4389)

and Pac-Comm (+1.813.874.2980) will have digital controllers, radios, antennas and accessories available for sale during the evening.
If you wish to purchase an item of particular interest, call them in advance of the event to make arrangements for pickup at the Conference.
Other manufacturers of Amateur digital controllers will be announced as confirmations arrive.

The evening will continue with more BOFs until we all decide to get some sleep!

Sunday, 8 November

The schedule is open to allow those who need to complete conversations begun earlier to come to a fruitful conclusion. The Coach House Diner is located across New Jersey Route 4 from the hotel and is open 24 hours a day. Many of us will be there around 8 AM for breakfast.

Air Directions

The Conference can be reached by commercial air to any of the following airports: Newark (NJ), LaGuardia (NY), Westchester County (NY) or Kennedy (NY). Newark and LaGuardia are within a $45 cab ride from the conference. Kennedy is a bit more. Definitely rent a car with a reservation if you plan on going to Westchester. (Note: It has been noted by some callers that Westchester is quite a savings on airfare.)
General aviation aircraft can fly into Teterboro Airport or one of the other local fields.

Ground Directions

From the East and Northeast:
Take Interstate 95 south to the George Washington Bridge. Continue onto NJ Route 4 West to Hackensack Ave. Go north one half block on right.

From the North:
Take the Garden State Parkway south to NJ Route 17 South to NJ Route 4 East.
Take the second Hackensack Ave. exit. Go north one half block on right.

From the South:
Take the Garden State Parkway north to exit 161 onto NJ Route 4 East.
Take the second Hackensack Ave. exit. Go north one half block on right.

From the West:
Take Interstate 80 East to the Garden State Parkway north to exit 161 onto NJ Route 4 East. Take the second Hackensack Ave. exit. Go north one half block on right.

The hotel address is: Best Western Oritani
414 Hackensack Ave.
Hackensack, NJ 07601
Tel: +1.201.488.8900

For hotel reservations please contact the hotel.

For Conference information call: Gordon Beattie, N2DSY
+1.201.387.8896 (Eve)
+1.908.957.6345 (Day)

73 & See you there!

Weeelllllllllllll.

It is TNC controller program for Windows 3.1 (IBM PC).
It is quite basic, so it should support most TNC's, I have tried it

with PK-88 and Tiny-2 type TNC's, doesn't use KISS mode or any other fancy
'host' mode controller protocols. I does support text transfer, YAPP will
be coming (I hope ;-) in a future version, I have the source (in Pascal :-(
but am a bit busy just at the moment. It supports normal windows stuff, such
as cut and paste with the clipboard. There are two text buffers, one for
receive and one for transmit, either can be from 1k to 1024K bytes (tho.
pointless for TX ;-) and lots more ;-)

Paul

Does anyone have any suggestions on what is available for programs
that are freeware or shareware to control the PK232? I also need
the unarchiving utility if you suggest something on a ftp site
on the internet. I used archie and found PK232.ARC and PK232COM.ARC
but I didnt look any farther with archie. Are these programs any good?
What is the unarchiving program I should use to unarc these? Thanks
for any replies.

It's a basic terminal program with seperate input and output windows, cut and
paste
and a few "Windows" features. It's a clean peice of work from what I can see,
however
I will not be using it (so no shareware fee) as most of my use for a TNC is in
KISS mode running TCP/IP --- It would be nice if it had a menu system for common
commands
a translate table for TNC specific syntax.

If you would like a Windows based terminal, with a few nice features for Amateur
use like "split" xmit and rcv --- get it and send a few $$$ to the author so that
he will be motivated to improve it.

John

Rick;

I think it is Poor Man's Packet if it is for the IBM. The
modem (you are correct) is also good for Digicom/64 with a
few external wiring changes. It could use Baycom Software
which was shareware and now is commercial. I have had
Digicom/64 since the Spring of 1987. It works great. I
stay off of HF packet as it is a pain. AMTOR is better for
HF from what I am told. You are better off using VHF/UHF/SHF
packet with the setup. Your computer is a TNC with the
Ramsey kit.

Sincerely,

Ronald Erickson

I can't help with the terminal, but as far as the PK232 goes, here is
a possibility... If it's in KISS mode and you are trying to get
out of it, three CTRL-C's in a row sent to it should do it. Of course
you need to send them at the right baud rate.

I have written TONS of code for this conversion over the last 15 years.
If you have the time I can probably find some of it for you. It may
take me a month or so to find it. In any event I have the conversion
tables someplace.

I am working on a project which consist of building a seismograph
 radio network for volcanoes monitoring.
I am thinking of a solution similar to the Amateur Packet Radio network.

The bit rate should be of 9600 bit/s or higher to insure continuous
measurements during high seismic activities.
The traditional 9600 bit/s phone modems use QAM modulation. This
modulation doesn't seem adequate in radio communication because of
the amplitude sensibility of the modulated signal. So I will
need a modem using FSK or PSK modulation, this will increase the
 bandwith of the signal.

Most transceiver are designed for voice transmission and have a 3kHz
bandwith. My transceiver must have a wider bandwith (20 kHz if FSK
modulation is used at 10 kbit/s).

Does anyone knows what kind of modem and what
kind of transceiver suits my application ?

Not much of late. They almost had it working, but then the volunteers
(note that word) got off onto other projects and it was never
finished. Last I heard they were hoping someone would volunteer
(there's that word again) to finish it off. I vaguely recollect that
the logic was working but it needed some work in the RF section.

see a recent copy of "The ARRL Handbook". i'm assuming the problem is that
you have to still send/receive your data in Baudot but have ASCII equipment.

otherwise it's almost always easier and even cheaper to pull out the baudot
equipment (mech. teletypes) and replace it with ASCII equipment (such as a
VT-100 or whatever).

Rather strange code follows:

RTTY code (baudot?)

letter   figures
  1 2 3 4 5

```
-----------
A - -
B -     - -
C   - - -
D -     -
E -         3
F -   - -
G   -   - -
H     -   -
I   - -     8
J - -   -
K - - - -
L   -     -
M     - - - *
N     - -
O       - - 9
P   - -   - 0
Q - - -   - 1
R   -   -   4
S -   -
T         - 5
U - - -     7
V   - - - -
W - -     - 2
X -   - - - /
Y -   -   - 6
Z -       -
cr      -
lf  -
sp    -

shift to letters
  - - - - -
shift to figures
  - -   - -

- = mark, space = space
```

mark is a neg, space is a pos voltage

Each character had a start pulse, and a stop pulse, in addition to 5 pulses in the pattern in the above table. Looks like the start is a space pulse, and the stop is a mark. Each pulse is 22ms long, except the stop, which is 31ms long. Going from letters to figures is done by a shift up, and going to letters is a shift down. Looks like if you are in letters, and the next character is to be a number, you have to send a "shift to figures" and then the pattern for the number. No case distinction on case for letters (guess you can't do UNIX on a baudot terminal!).

This info was pulled out of the '77 ARRL Handbook, page 459

Greetings.

I checked the FAQ and Pete's (KA3RFE) packet guide, but I still have
some questions:

1) I have a Radio Shack Model 100 and a Yaseu FT411E that I want to
   use for a portable packet station. I figured out that I need a
   TNC and connector cables to hook them together, but it's not clear
   to me whether I need special software for the M100 to make it all
   work. Do I? And if so, where do I find it?

2) Once I get the necessary parts together and working, how do I figure
   out how to send mail via all those digipeter/nodes/gateways? Do I
   just post mail to my own PBBS, or do I connect to some other BBS and
   tell it about my own PBBS, or what? Just how do you find out all the
   info you need to mail from point a to point b? Someone around here
   told me that the local "lan" was on 145.05, but there was no gateway
   to the "trunk" on 145.01 ... does that mean there is no way for
   me to send mail out of my local "lan"?

3) Is there any store-and-forward capability in the packet network, or
   is it only point-to-point? I'm not planning on leaving this thing
   on 24 hours a day ... will someone only be able to send me something
   if my station (and all other necessary ones in between) are up and
   running?

Sorry for all the questions, but the book I read on "how to get started
in packet" didn't really explain how to do packet very well for a complete
novice (well, tech actually ... whenever my license gets here ... and yes,
I'm studying the code for my general upgrade).

Many Thanks & Regards,

Darryl Marsee

>upgraded to 32K memory?
*----
No - my TNC-200 is all original. What do I have to do to augment the
memory? Lights come on with the new ROM, so SOMETHING is executing.
It could definitely be a memory problem.

Not that $ 12.00 is a big problem, but I already have a PROM programmed
(from code found on the network, dunno if it's 1.1.8a or not) and if
I need to augment the memory, buying the TAPR prom won't help anyway.

*----
Baudot is well-documented, and any book on RTTY, old copies of the
Radio Amateur's Handbook, and many books on digital communications
list it. A few years ago I wrote a program that converts my old

baudot picture tapes to ASCII, and you're welcome to a copy. Since
my "new" tape reader was designed for more modern tapes, and my
kleinschmidt reperf used wider tape (and printed along the bottom)
I had to read them in upside down and backwards. My program
compensates for that, but it's easy to change back.

Hello all!

I'm interested in running TheNet X-1G with the RS-232 port in mode 2,
that is, so that the radio and the KISS application off the RS-232 port
can share the radio.

My TNC is inside a rack-mount box, and the only 2 wires going out are
pins 2 and 3. Do I need to hook up 4, 5, 6, and 20 as well (for hardware
handshaking)?

Anyone out there trying this out?

jan.

I'll start the answer, but others may have to fill in parts. No flames, please.
I am not trying to describe all possible senarios, just common ones and I might
make a mistake or two at that.

If I remember the Model 100, it has a com port and a built in communications
package.
If my memory is correct, then that is all you need in the way of software.
Anything
that looks like a dumb terminal (or smarter) will work. Of course, there is a
lot you can do with a software package designed for packet work that compliments/
extends
the capabilities of the TNC.

Normally you will send mail addressed to someone at somewhere. It works a lot
like the normal net mail in that the someone is separated from the somewhere by
the @ sign. E. G. k4gvo@wd4elj.va.us (Or is it usa?) You don't have to know
the route it takes normally. If you just post to his call only on your own BBS it
will
probably just hang around there waiting for that person (station) to login and
pick it up.

|>   me to send mail out of my local "lan"?
Not enough info here to tell. Ask the direct question, "If I send a message to someone in Podunk, Iowa, from this lan will it get there?". If the lan is truely local only, then the answer will be "no". If the lan has some connection with other networks then the answer will be "yes". The "trunk" on 145.01 may not be the
only way to get data out of the lan. (By the way, lan means "local area network" so
local lan sounds funny, but is not as bad as "best 73's" 8^))
|>

|>   if my station (and all other necessary ones in between) are up and
|>   running?
There is a lot of storage on the network. It is almost like the normal phone line bbs services or the Uni* e-mail. You don't have to be logged on at the time the message
is sent. In the worst case it may take several days for a message to "hop" accross
the country and spend a few hours on many computers in transit. It will remain at the
bbs (wd4elj in the above example) until you read and kill it, the sysop gets tired of
seeing it or some automated function of the bbs deletes it after N days.

Note: No one will send you anything unless you are running a BBS yourself (and the other
BBS's know to do so) or you log into a BBS and request the message so leaving your equipment on 24 hours a day won't do much for you unless the other party is on the same lan and wants to just connect to you and dump a message to you (or your mailbox if
your TNC has one, but that is a different subject).

Your radio, computer and TNC act a lot like a terminal and modem tied to a phone line.
When you "connect" using your TNC and radio to a BBS you are doing the same thing as
dialing your modem and hooking to a BBS via the phone. The "look and feel" of the packet BBS's is different (simpler) from the phone BBS's, but perform similar functions. Like phone BBS's there are a number of varieties of packet BBS's, but most of them will give you some help with the keyword "help" the letter "h" or a question mark.

I am posting this for a friend who does not have net access,
but can receive e-mail by UUCP. Feel free to send responses to
me if mail to frank bounces. His address is
frank%xcntrk@relay.sgi.com.

---Included text follows---
I am sorry you made the same mistake that I did and bought a packet
modem from Ramsey as I did. BUT, I have a fix for it that made mine
into something that Ramsey never thought of, "A REAL WORKING PACKET
MODEM" Their basic idea is sound, but not their circuit configuration.
Here are the steps I used to cure the "HARD CONNECTS".

1 - Remove C14 and replace with a .1uF monolithic or ceramic. Anything
     over 10 volts will do nicely.

2 - Remove JMP7. This removes +5v from pin 10 of the TCM3105JL chip.

3 - Short pin 10 to ground.

4 - Remove R12 and R16. These are 10K resistors that are not what
     should have been used in the first place. Replace these resistors with
     a 50K or 100K trimmer pot. One end of the pot goes into the hole that
     R12 ocupied (+5v) and the wiper terminal goes into the other side of
     R12. This leaves 1 open. The lead goes to ground. Center the pot at
     mid point. This is a good place to start.

5 - If you wish you can place back to back 1N914 signal diodes across
     R17. This will prevent the voltage from the speaker (data) to exceed
     .6v so as to protect the TCM3105JL chip.

6 - Tune up is simple! Connect up to computer and activate Baycom. You
will find that instead of the low LED on, the HIGH LED is on, don't
worry. Listen for a WEAK digital signal, less than 1 S unit and turn
the new pot you have installed ever so slightly either way. The data
will start to flow in and show on your screen.

I have found that excessive audio now is NOT needed. Turn the volume up
just enough to make both the LED's wink and blink. Too much audio and
the data gets distorted. I found that the modification worked GREAT for
me. I am about a half air mile from our club PBBS and no matter where
I had the audio set or the amount of power I used I could not get a
CLEAN connect. Well I do now in one request. The problem I found was
that the +5v regulator was not staying even close to +5v. It had gone
down to less than +1v during some data input. The replacng of R12 and
R16 to a larger value presented less load and the removal of JMP7
lightened the load. R12 and R16 are bias resistors for the modem chip
also. With the value being adjustable now you can FINE tune the chip
for optimum proformance and keep the +5v line above +4.5v...

That is correct as to the status of about a year ago. The TAPR Board of
Directors officially killed the project in March, 1992. The digital part
ended up as the basis of the TAPR 9600 bps modem kit.

>kind of transceiver suits my application ?

Modems for 9600 bps FSK operation have been used in Amateur Radio applications for several years. Papers have been presented at the ARRL Amateur Radio Computer Networking Conferences by Steve Goode, K9NG, and later by James Miller, G3RUH, on modem design, with some discussion of the radio requirements. The radio must not have any pre- or de-emphasis. Most amateurs have modified "normal" f.m. radios for this purpose, although there are some "data radios" being made which do not require modification. Some of these have been reported to be marginal in performance for amateur radio applications.

Sources of modems and data radios include:

  I have a unix system (intel based) running on an Ethernet
network. Being new to all this, I may sound a bit, well, new.
So, what I'd like to do is get packet radio by either putting
something on the ethernet, or via an add in card or something
like that.
  I would appreciate any suggestions on how best to do this
AND even better would suggestions on where I can get such
equipment.
  The unix I use is USL System V Rel 4. TCP/ip over the
Ethernet.

  Best respond to speers@zenia.mcds.com   THANKS!

Well, Dan, I don't see a call anywhere so can I assume you aren't a licensed
radio amateur?

The first thing to do if that is true, is get a license. Then you will
need a TNC and a radio. Since you have a computer the simplest way for you
to get on packet would be to hook a TNC to the serial port on your computer.
Use kermit or any other communications program you have avaliable on your
Unix system to access the TNC. I don't know of anything available
that bridges from ethernet to packet (simple, that is).

You will most likely be disappointed in the speed of packet communications with speeds of most networks in the 1200-2400 baud range and with lots of stations sharing a single channel, the effective rate is somewhat less than 50 characters per second on a moderately busy channel. I say this knowing that you are probably used to the speeds found on ethernet networks.

With that said, try it out, it can be fun.

73,
Jim.

There have been several requests concerning english manuals for
Digicom>64/128.
As far as I know, a translation for the old version 3.51 exists, but I
have never seen it yet. A guy from england told me, that somebody has
translated these 100kB of text.
In June 1992, we published Digicom Version 5.0. This program, most parts
written by Daniel, DL3RDB, has not many new features, but is much better
in performance. As an additional feature, you can connect a little
slotcard to the expansion port (carrying a Z8530 and 5 TTLs). By using
this card, called SCC.64, Digicom can operate on two independent HF-ports
with baudrates from 1200 - 19200Bd. This development was necessary due to the
increasing number of PR-user access in germany, operating on 9600Bd.
Though there is an english version of the program again, we still couldn't
manage to get the manual translated into english. I asked Denis, G0KIU,
who has translated most of the BayCom-Manuals, but still didn`t got any
feedback. But I still hope, that this word can be done in the next months.

Put a frequency counter on it and see what that does.
I do not have a schematic of what you are working with
so I can not diagnose it from here. It sounds like
a voltage level adjustment. What does the pinout say
on the schematic? I have the 7911 cousin circuit which
operates on a similar principle, but I am not sure how
similar it is.

Sincerely,

Ronald Erickson

A couple of people asked me what was actually wrong with the modem,
I apologize for having taken so long to post this, but here it is.

I had posted about problems with a BayCom-type modem, the TCM3105.
Basically the computer wasn't receiving anything. I got the
schematics via ftp from Simtel20 (many other ftp sites have the
same file), the filename is "tcm3105.zip" which contains "tcm3105.ps"
this is a PostScript file of the schematics, and "tcm3105.txt" which
is the parts list.

This is an old copy of the schematics and was corrected over a year
ago, but it seems there are still old versions around the net.

The problem was: on the schematics two resistors are labled "R2", one
goes to the computer's CTS pin, which receives the decoded data from
the modem, and the other R2 is connected to the computer's RTS pin, this
activates the PTT on the radio. I first tried putting 100Kohm resistors
on both, but this was too high a resistance for the computer to read
anything on the CTS pin (decoded data TO computer), therefore it seemed
as though nothing was being received.
I believe the correct resistance for the resistor to CTS is 2.2Kohm,
this works fine for me. The resistance to the PTT line can be 100Kohm.

Even though the authors already corrected this quite a while ago, some
of you might still run into this version, the schematics are dated
April 4, 1991.

Hope this helped, 73,
Brit

I need to extend an either net about 400 yards by radio link. I
am thinking of using wide band fm in the 10 GigiHz range and trying
to hook the either net direct to the either net no protocall change.
I would welcome oppinions and experiances.
thanks

Subject: rsgb gb2rs news 25th october
Distribution: world
Organization: 5/10
Lines: 149
Date: Sat, 24 Oct 1992 07:09:29 +0000
Message-ID: <719928006snx@tedb.demon.co.uk>
Sender: usenet@gate.demon.co.uk

Good morning. It's Sunday the 25th of October and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The RSGB's Annual Report has been published, together with details of the forthcoming RSGB Council elections; and the City and Guilds report record successes in the Spring RAE and NRAE.

The November edition of Radio Communication was posted to all RSGB members last week. Enclosed with it is the Society's Annual Report which includes Council Election candidates' statements, the ballot form, a proxy form for participation in the Annual General Meeting, and a reply-paid envelope. Any member who has received his RadCom but not the Annual Report should contact Justine Hodges at RSGB Headquarters. Members' attention is also drawn to the notice on page 6 of the November RadCom which details the arrangements for this year's Annual Meeting of the Society.

We are sorry to have to report the death last week of Francis Rose, G2DRT. Mr Rose was an RSGB Council member until last December and had been nominated as a candidate in the forthcoming Council election.

The City and Guilds of London Institute has published its report on the June Novice Radio Amateurs Examination. It shows that a record number of candidates - 369 - sat the exam. City and Guilds attribute the 74% pass rate and high standard of candidates to the RSGB's "well organised training schemes and the standard of instruction and guidance given". Another City and Guilds report, this time on the May Radio Amateurs Examination, mentions a pass rate of over 81% which is the highest for several years. It goes on to say that "most candidates had an excellent understanding" of EMC. The report also expresses a hope that future candidates will gain more practical experience before sitting the exam.

Following successful tests of the RSGB's new propagation data beacon, callsign GAM1, it has been necessary to apply for a new frequency for reasons of international cooperation. The proposed alternative of 3.821MHz {note to newsreaders - this really is outside the 80m band} has already been cleared by all the UK agencies but international approval is still awaited.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Grenada, K8CV, NY8E and WA8LOW will be active respectively as J37C, J37E and J37L from now until Tuesday the 27th of October. From Minami Torishima, JK1ABP will be active from now until January 1993 on all Bands using SSB, CW and Packet. JK1ABP will sign JA9IPX/JD1 on the normal HF bands but JK1ABP/JD1 on the WARC bands. From Easter Island, SM0AGD, SM0OTG and LA7XB will sign own-call/CE0Y from Wednesday the 28th of October to Thursday the 5th of November, on CW on the WARC and LF bands. From Faeroe Islands, G4XRV will be active as OY/G4XRV from Sunday the 1st until Thursday the 5th of November, using mainly CW on the 10, 15, 20, 30, 40 and 80 metres bands. From Cocos Island, the call sign TI9JJP will be aired by TI2JJP and possible others, from Sunday the 1st to Wednesday the 11th of November.

Rally news now, and we know of no rally today, Sunday the 25th, but there are two rallies scheduled for next weekend: The North Wales Radio Rally and Electronics Fair will be held at the Aberconwy Conference and Exhibition Centre, Llandudno, on Saturday the 31st of October, and Sunday the 1st of November. Doors open at 11.00 am. There will be many stands including, an RSGB Book stall, club stands and a bring and buy stall. Refreshments will be available as will ample free parking space. Talk-in is to be on channels S22 and SU8. See October's RadCom page 62 for more information. Further details can be obtained from GW7EXH, by telephoning 0745 591704. The North Devon Rally will be held at the Holsworthy Memorial Hall, Holsworthy, North Devon, on Sunday the 1st of November. Doors open at 10.30 am. Further details from G8MXI whose address is correct in the RSGB Call Book.

Next some dates for your 1993 diary:

The RSGB VHF Convention will be held on Saturday, the 6th of March, the RSGB National Rally at Woburn is scheduled for Sunday the 1st of August, and the Society's National Exhibition will be at the NEC Birmingham on Sunday the 16th of May.

Contest news now:

The November edition of RadCom which has been posted to all RSGB members contains the full results of HF National Field Day plus a full band-by-band report. This weekend, the CQ World-wide DX SSB Contest is taking place. It started at 0000 yesterday and finishes at 2400 today, Sunday the 25th. All bands 160 to 10 metres will be used, excluding the WARC bands. See October RadCom page 19 for brief information. Another in the RSGB's 432MHz Cumulative contest series takes place next Thursday the 29th of October. It runs from 1930 to 2200GMT. also, the second of the RSGB's 1296MHz Fixed and SWL Contest takes place on Sunday the 1st of November, from 1600 to 2000GMT. For further details on either of these events, see June RadCom page 65.

Special events this week include GB2KSS which operates from tomorrow, Monday the 26th, to Friday the 30th of October. Five members of the Yeovil Amateur Club will be bringing amateur radio to a group of 14 year olds at the Kilve Court Space Science Course near Bridgewater in Somerset. The Special Event Station will be on HF and VHF during this course to give some of the youngsters hands on experience of amateur radio. A special feature of the course will be demonstrations of Slow Scan Television.

And now the solar factual data:

The period 12th to 18th October has seen very unsettled geomagnetic conditions with a minor storm commencing on the 14th. The HF bands have been below or just about average with no flares reported. Sun spot counts meaned about the 80s but tended to increase during the period. Solar flux levels averaged 105 units, slightly down on last week. The geomagnetic Ap indices averaged 23 units but were up to a sub-storm level of 31 on the 15th, and were very unsettled throughout the period. The state has been nil, nothing to report, all the period. The radio quality indices varied from poor to just normal with the best periods being on the 13th and 18th. The aa indices, as reported by

the British Geological Survey for the period 6th to 12th October, gave a daily average of 28.7 nanoTeslas but varied from quiet levels on the 6th up to very unsettled by the 12th. One period reached 102 nanoTeslas.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 8.8MHz but varied from 6.1MHz on the 12th up to 10.4MHz by the 17th. The darkness hour lows averaged 2.2MHz but have not varied much day to day. The minima are now around 05.00 hours, and the maxima 12.00 hours.

Now the ionospheric data for the North:

The F2 daytime critical frequencies at Sverdlodvsk averaged 7.7MHz and the darkness hour lows 3.0MHz. Solar cycle 22 is now declining very rapidly. Solar rotation 1860 has just been completed and produced 21 type M flares and no X type, whereas rotation 1846 this time last year gave 33 M and 3 X flares.

And lastly the solar forecast:

This week, the quiet side of the sun will be rotating away, there are some coronal holes on the disc and these may cause the geomagnetic field to be very unsettled at the beginning of the week. Solar flux levels are expected to be about the 110s. MUFs on north/south paths during day time are expected to reach 30MHz, and the darkness hour lows 18MHz. East/west paths should be best around midnight on 10 or 14MHz.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S O and G7 N U series, and Novice calls in the 2 0 A D and 2 1 B D series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

I am trying to compile the 920528 version of the KA9Q TCPIP software

for packet radio under the SCO ODT 2.0 operating system. The very
first file, n8250.c, calls for a file called sys/vty.h. My system does
not seem to have this. Is it available? Where can I get it? Is it
short enough for someone to mail it to me?

Also, is there a decent tcpip/packet package that will compile under
SCO ODT 2.0? I would like to run a TCPIP-based packet BBS that has as
much functionality as possible. Please reply to
perry@leopold.jpunix.com. Thank you in advance.

Finally, someone who concurs with me! :-)

I tried to do some research on the subject of Kantronics TNC's having a
watchdog timer. I discovered that Kantronics does sell a watchdog
timer for the KPC-1, KPC-2, KPC-4, and the KAM for $15.

I also found that the KPC-3 (Mini-TNC) and the Data Engine do have
watchdog timers.

>Ethernet.

There are three approaches that will get your system on packet.
The simplest method is to attach a TNC and radio to a serial
port on the system and run KA9Q for Unix. This will give you
TCP/IP at 1200, 2400, or 9600 baud depending on the modem in
the TNC. Interfacing the KA9Q code to your native Unix is left
as an exercise to the reader. :-) It can be done as a user
process with pty loopback.

A second and higher performance method is to install an Ottawa PI
card, or Gracilis card in the Intel box and write a device driver
under Unix for it. This will allow you to attach a 56 kbs modem
to the system. Layering AX25 under your native TCP/IP is left
as an exercise to the reader. :-(I haven't heard of anyone who
has successfully done this with Lachmann TCP/IP. It will have
to be a kernel process.

Probably the easiest and best method is to scrounge a DOS PC and
put it on the ethernet. Install a PI card and the KA9Q software
with Clarkson drivers for your ethernet card and the PI card.
Now the PC will act as a transparent gateway between your TCP/IP
on your Unix box and the 56 kbs high speed packet modem attached
to the PI card. This uses a bit more hardware, but is off the shelf
plug and play.

Im not sure what you are asking, but it can be done. I can only afford one radio, and I use my 2SRA for packet with no problem.

It depends on what TNC you use, but it is wired with capacitor to a 1/8 inch stero plug so it can use the PTT and speaker from the one jack.

Let me see if I got this straight...

To get started in packet radio, I need an amateur license, a terminal, a TNC, a modem, and a radio.

The terminal takes my keystrokes and turns them into a code, let's say ASCII.

The TNC takes that ASCII and, using some magic, turns it into a series of 1's and 0's, that aren't ASCII.

The modem takes all those nifty 1's and 0's and turns them into audio tones--beeps and boops.

The radio takes those beeps and beeps and sends them flying out into space.

When receiving, the process is reversed.

Do I have all this straight? I think I do. It also seems to me that the TNC can be either hardware or software, if you've got a smart terminal. Now for the brunt of my question: provided I have all the above theory right, and a Commodore-128 with disk drive that I'd be willing to dedicate to packet, what do I need to get going? The radio part is easy, but what do I need in the line of TNC/modem/software? Is hardware or software TNC better and why? And what products are reccommended by you and why?

Thanks for helping. I'm interested in packet but as you can see have no idea where to start. Any tips would be appreciated.

Dear interested reader,

I am currently running ka9q nos modified by YC1DAV to include the NNTP server. While everything appears to run just dandy here, and other nos switches poll and receive the newsgroups properly, there is still one thing that remains a mystery. How does the client read the news? I have seen reference to NNTP groups being read by BM, but I als have seen reference to news readers. I am not on the Internet directly, and get current tcpgroup and Usenet from a local bbs. I manually manipulate the newsgroups intp the proper dirs and really only offer a read only NNTP service. If any of you NOS gurus have any tips, please email them. Thanks in advance...Glenn.

The modem is contained within the TNC.

Well, any communication program will work. If you are using your C-128 to connect here via modem, that is all you need on the computer end. The software to run the TNC appropriately is already contained within the hardware of the TNC.

The "hardware TNCs", as you put it (I dont think that is the exact term, but I think we all understand what you mean), work just fine. I personally dont see the reason for having the code in software form. I'm not saying it is a bad idea, I just have had no reason to really look into it because the hardware method does everything I need. If anybody else wishes to comment on that, please do so. I am interested in hearing why some prefer it too. I suppose it is for more advanced packeteers to hack aroun

d with the code. I really dont know why.

Also, back to computer software, there are specific packages to optimize your use of the TNC with your computer, depending on computer and TNC make, of course
  I don't know much about C-128s, but I do remeber seeing software ads for them.

Basic terminal software will work fine if you want to use AX.25 protocol packet, but if you want to run TCP/IT, you will need specific TCP/IP software to do this. Others know more about this than I do.

Basically you need:

1. An amateur radio license
2. A terminal or computer (with software to make it dumb :)
3. A radio (depends on what band you want to operate in)
4. A TNC
5. and an antenna. A lot of people don't place enough emphasis on the antenna, but it is a very important aspect of your station.

Hope that helps,
JT N8PUY

>Let me see if I got this straight...
>
>To get started in packet radio, I need an amateur license, a terminal, a TNC,
>a modem, and a radio.

Well you certainly need the license. A terminal, TNC, modem (low speed ones are usually built into the TNC), and a radio is one approach to packet. It's very limited, low speed, and expensive, but it's what many are using. There are other ways such as direct RF modems and plugin digital interface cards for systems like the IBM PC clones.

>The terminal takes my keystrokes and turns them into a code, let's say ASCII.
>
>The TNC takes that ASCII and, using some magic, turns it into a series of 1's
>and 0's, that aren't ASCII.

It turns it into bit stuffed HDLC frames with attached packet headers and checksums. This is the thing that allows multiple users on a channel and detects any errors requiring retransmissions.

>The modem takes all those nifty 1's and 0's and turns them into audio tones--
>beeps and boops.
>The radio takes those beeps and beeps and sends them flying out into space.

Some modems use AFSK or FSK modulation that is equivalent to two shifted tones, one tone for zeros, and another for ones. Since the frames are HDLC, it doesn't matter which tone is which, only the transistions matter. Other modems use different schemes from PSK to QPSK to MSK. These are normally used at higher speeds. The modem may operate at audio frequencies, thus requiring an expensive radio, or it may generate and receive the modulation *directly* at radio frequency negating the need for a separate radio, as the GRAPES 56kb RF modem does. Voice grade radios simply aren't suitable for higher speed packet.

>When receiving, the process is reversed.
>
>Do I have all this straight? I think I do. It also seems to me that the TNC
>can be either hardware or software, if you've got a smart terminal. Now for the
>brunt of my question: provided I have all the above theory right, and a
>Commodore-128 with disk drive that I'd be willing to dedicate to packet, what
>do I need to get going? The radio part is easy, but what do I need in the line
>of TNC/modem/software? Is hardware or software TNC better and why? And what
>products are reccommended by you and why?

The most common setup uses a hardware TNC, usually a copy of the TAPR TNC2, or a multimode hardware box that can also do RTTY and AMTOR such as the PK232. I prefer the MFJ1270B or the PacComm Tiny 2 since they are copies of the TAPR design and can use the hardware and firmware add ons available from third parties for higher speed packet and for different operating methods such as the KISS mode required for TCP/IP. The Commodore 128 is a limiting factor since there is very little packet specific software produced for it. Most of the newer stuff revolves around the IBM PC clones and the Apple Mac, with a bit of Amigia and Unix software available as well. Since the 128 will run most of the software for the older Commodore C64, some of the programs developed for it may work. TCP/IP is out, however, because it requires a bit more horsepower than the C128 provides. There are DOS, Mac, Amiga, and Unix versions of the TCP/IP software available.

There are also "software" TNCs available for the C64 and the IBM. These are very limited low speed methods of using your computer to emulate the hardware actions of a TNC. I don't know if there is a C128 specific product out there.

Hope this is useful.

As the subject says, I have a Standard C168A that I want to hook to a TNC.
Any suggestions? - Gary (It will probably be a MFJ 1270B or 1278T)

I need (well Ray needs) to know who the IP coordinator is for Maryland?

My oldest Ham buddy Ray N4GYN is hooked, but needs an IP number.

He lives in Columbia, MD.

Can you help me?

I've seen Ardis, a joint venture between IBM and Motorola, mentioned
lately in the context of mobile computing. Can someone give me a
pointer to some detailed info on this? I'm interested in what technology
it uses, how much it costs, where it's available, and what connectivity
it provides (roamer to roamer, roamer to dialin base, roamer to Commercial
Internet Exchange, etc.).

Communications Week, Oct 19 (pg. 29) mentions a Bell Atlantic digital
cellular service. From the description of the system and its application
(telemetry) it doesn't seem to be useful for linking roaming computers
with their home LAN's.

The second part of my query is about Qualcomm. They are a new (?) company
in San Diego (?) developing a new digital cellular technology (?). Are
they marketing products, or licensing the technology to other manufacturers?
Can someone give me a pointer to a paper on the details of their system?
I am also interested in projected cost, required equipment, and connectivity
provided.

If there's interest, I'll summarize.

Thanks in advance,
--- sdp

Hopefully I'll get my license soon; I'm taking the test in about 24 hours! One aspect I'm interested in is packet, hence the post here. I have a PC, but I would really like to use my PDP-11 for packet access; I may even consider turning it into a BBS if I *really* get into it.

I understand the packet code is written in C, so I need to get hold of the source, so I can do the necessary porting. What other pitfalls can I expect?

BTW, before anyone asks, my reason for wanting to use the PDP-11 is geographic. My PC is located upstairs, and my "shack" will be located in the basement, where the PDP-11 is.

There is a list of AMPR coordinators at ftp.cs.buffalo.edu under
/pub/ham-radio/ampr_coordinators or at ucsd.edu (I forget the filename).
The ucsd.edu copy is probably more current.

Contact Brian Kantor, brian@ucsd.edu, if neither list is up-to-date.

You don't, because there is no problem in that instance (i.e. it's

no different than swap nets, which according to an FCC advisory, are
explicitly legal.)

I was going to send email, but thought this might be of interest to
everyone. Wyse can be reached at 1-800-800-WYSE. They have a faxback
service available 24hrs/day, with several hundred topics available on
all of their terminals. The pinout for a wyse50 is document #11307.

In response to:

JOHN AGNEW

John,
   I took the lazy way out and purchased the MFJ cable connectors to connect my
 ft470 to a KAM and a MFJ-1274. This I use for testing purposes from time to ti
me. Works fine for my purposes.
   I believe QST and one of the other radio mags here published the instruction
s and schematic for the connector. Maybe someone else here may have the dates a
t their immediate disposal.

Hi Folks,
   This is, I know, not the best place to ask this question, but I thought
someone might have an answer. At our site the mainframe computer (an aging
Burroughs) is connected to office PC's in many cases by wire. The device
that goes on the PC end is something called a T-CON TDI converter manufactured

by Computer Peripheral Systems of Atlanta, Ga. The Unysis Corporation resells these to our college and gets $175 a copy. This is one of the reasons that more Pc's aren't connected to our E-Mail System.

   I cracked open one of these T-Con's the other day and was surprised to find standard 1488 and 1489 level conversion chips, a 76LS126 and assorted resistors, capacitors, and diodes. I figure if I purchased all the chips and parts at Radio Shack (They might not carry the one logic chip, but even so) the total cost of parts wouldn't be more than $15.

   Thus it seemed to me that A. Perhaps there is a cheaper source of these things than the current supplier, and B. If I obtained a schematic (or perhaps reverse-engineered the thing) I could build one for a whole lot less than $175. Anybody have any ideas on this? Thanks, John WA0PTV

|> to english.

I have wondered about this in the past. The FCC has a list of words you can't say on the radio (or tv for that matter, remember George Carlin??) But these words are in ENGLISH. Does it say anywhere in the CFR what foreign words are not allowed?? Kind of sounds like the same old argument "I can't define obscenity, but I know it when I see it!!" Is something obscene or indecent if the majority of listeners can't even understand it. Benny Hill used to make a lot of lewd and indecent comments (by FCC standards) on his programs. I honestly figure he got away with so much cause the average american didn't get the joke anyway.

So what's the definitive word here?? Are foreign naughty-bits not allowed??
Or can we get by if we just translate all our traffic into Esperanto?? :-)

3 years ago I did a survey of packet radio users. I'd like to do the
same again, and see how packet has changed.

Last time I received 195 responses. I'll summarize and post the results if
I get at least 200 responses.

Question 1 to Users
What computer, software and TNC are you using?

Please format your reply as follows (for computer processing)
USER COMPUTER   SOFTWARE   TNC   CALL (optional)

example,

USER PC 386   Best_Packet   ABC-123 G3ZCZ

Question 2 to PBBS operators
How many users does your PBBS have, what BBS software are you running?

Please format your reply as follows (for computer processing)
BBS SOFTWARE   USER COUNT   CALL optional

example

BBS BBS 3.1   27   G3ZCZ

The call field is optional, but may supply some correllation between
geographic area and equipment.

Please format the reply, so I can process the answers by computer.

Any info returned will not be used for generating mailing lists or any
purpose other than looking at the distribution of equipment/software
and trying to estimate number of packet operators.

Thanks

Joe

Hello,

I hope this is the correct group to ask this query.

I am using PA0GRI NOS 911229 2.0m on a 386 computer using
a FTP Software type packet driver and a Cabletron ethernet card.

I have the software configured okay, to send and receive mail
using SMTP, and for other microcomputers to send and receive
mail from my computer via the POP3 server that is provided
with PA0GRI NOS.

My users have no trouble picking up and sending mail through
my computer.

The problem is that if mail is addressed to a NON-EXISTANT

USER on my computer, the mail is not bounced back, but sits
in my ~\spool\mail directory is as a "user".txt file, where
"user" is the name of the non-existant user.

I would like to configure NOS to bounce such mail back to the
sender, but cannot figure out how to do this. Can someone
please help me?

Thank you,

Ashok Aiyar

Sounds like what you have is an ethernet tranciever. 'bout the lowest I
have seen them for is $125. You would probably also need the actual
Ethernet interface for you computers...

Not that this has a lot to do with Packet radio...

So, a question...

Is there any KA9Q package that would allow for bringing up a connection,
probably a SL/IP line, if and only if there were traffic for that connection?
As in, if I had a computer on an ethernet, or a packet net, and wanted to
send traffic via LL, but didn't want to keep the LL open all the time, is
it possible to set up KA9Q or its varieties to dial on demand?

73's.
Later.
Dan
(who is working on a ticket, and really should just go take the friggin' test

Yes. This has been in my version of the code (at least) for some time.
It has gone through some changes, and I'm about to generalize them so
it's possible it will change again. Currently you specify a "script"

file with commands to dial a link when there's traffic, and another
script with commads to drop the link after a configurable idle period.

I use it from home to talk with a Telebit netblazer at work, and it
all functions quite well.

Please don't ask about documentation, as I said this stuff is experimental
and in a state of flux. If you want to play with it, read the source.

The aforementioned "generalization" will allow the demand-dialer feature
to work with interfaces other than SLIP, e.g., AX.25 connections, which
right now are opened on demand and never closed. When I get all this
done, THEN I'll document it.

Phil

I had previously asked whether it is possible for NOS to bounce
mail that arrives for a "non-existent" user on my system.

Specifically, is there anyway that I can have NOS check the
/alias file and/or the /ftpusers file when mail arrives at my
system via SMTP. If the addressee if not in one of those files, can
NOS automatically bounce the mail back to the sender (again via SMTP).

Is there any version of NOS that will do this. I have tried WG7J NOS
1.04 and PA0GRI NOS 911229 2.0m, and cannot find anything in the manual
that will permit this.

Does anyone have any ideas/ways for me to get around this, without
having to send the mail back manually?

Ashok

A number of pieces of software were mentioned in the recent 73
article on building the PacketMac Modem (PMM). These are NET/Mac,
SoftKiss, Virtuoso, Savant, and the PMM hypercard stack.

The article mentions that NET/Mac and SoftKiss are available from
Compu$erve.

Are the most recent versions of these packages
available by FTP? If so, where?

Also, is there up-to-date documentation available by FTP for ka9q
in general and NET/Mac in particular?

Jon, N8PAP
jon@cas.org

p.s. I just saw that SoftKiss is available from
akutaktak.andrew.cmu.edu [128.2.35.1]. Thanks, Aaron!

Hello,

Has anybody come up with a documentation set for AmigaNOS yet?

Does anyone know the fix to stop monitored information packets in the
trace mode from overwriting the previously printed line?

In the interests of saving some $$, I'm thinking of building the
PacketMac Modem described in the October issue of 73 as an alternative
to buying a (first) TNC, but I'm afraid there are some hidden costs I'm not
aware of. Here are a few specific questions:

What sort of equipment is necessary to test and calibrate the circuit?

Will I be able to do everything a low-cost ($100-$150) TNC
can do?

Can I still do non-TCP/IP packet?

How could/should the circuit be packaged?

My experience is with systems software (in particular UNIX systems), but

have little experience with radio. I built simple circuits in
college (10 years ago), but don't do much with hardware on a
day-to-day basis. Would I be getting in over my head?

Related observations would also be appreciated. Email is preferred,
unless the response has broader relevance.

I've been using the 229-H in packet service for about 2.5 years now, and have
just recently noticed that the transmitter doesn't want to go to full output
power at keydown. If I connect the mic to it and let it stay keyed for several
seconds, it will eventually come up to full power. The xmitter IS working,
even tho it does not always come up full power. Anybody else seen this kind
of behavior with the 229-H ?

Earlier today I was in at my favorite electronic surplus store, and
they were selling a number of old Motorola pagers. These are the simple
sort that just beep when they receive the right "code". Based on the
tags attached, I gather most (all?) were designed to listen to
frequencies just above 149MHz. Before I spend money and/or start
pestering Motorola I wonder if anyone on net could help with the
following questions:

- How hard/easy is it to change the frequency these units use? I would
  (of course) want to bring it into the 2 meter amateur band.
- How hard/easy is it to determine the code a given pager is set to?
- How hard/easy is it to alter that code?
- How hard/easy is it to produce the code used to turn on the pager?
- How hard/easy would it be for my 2 metre HT to produce the code?

Now for the legal questions:

- Is the turn-on code for a pager considered a "secret" code (at
  least as far as Canadian rules are concerned)?
- If I were to use this as a paging system with other hams I assume
  there would be no problem, I send out a call, and within a few
  minutes hams show up on a given frequency (ie: a crazy version of
  "CQ VE3...."). If on the other hand I hand a pager to a non-ham
  family member, and then activate the pager, would this be a
  "broadcast" (ie: here we are talking about a crazy version of
  "Phone home")?

Thanks in advance for any help, and if there is enough interest I will
post a summary of what I learn.

Does anyone know of a version of AmigaNOS that supports AREXX? It would be real nice to be able to have a second program controll NOS, and do various things.

These thoughts are only my own. CHBeck@anl.gov

I have been looking for PMP kits. Baycom kits could do as well. Could anybody e-mail directly to me any help? Thanks. Harold. <hsanchez@ucrvm2.bitnet>
----------Original message----------
On June 15 1992 I sent a $37 cheque for a PMP kit to:

   Kevin Feeney
   PO Box 323
   Newfield
   NY 14867

The same day I e-mailed Andrew Payne and Kevin Feeney telling them in advance about the order to:

   payne@theory.tc.cornell.edu

Since there was no reply I repeated the e-mail on June 24, July 9 and July 28 with the same result.

On August 19 the mail order was returned to me by the post office. The reason:

"unclaimed".

What happend to the authors of PMP, Feeney and Payne?

Could someone e-mail directly an explanation or help me locating them?

Thanks in advance.

I have incorporated a subcommand (2 actually) to the SMTP command which does
exactly what you require:

smtp reject "gz9asd"
smtp reject "iw9asd"

will reject all messages with either gz9asd or iw9asd anywhere in the From:
line, this was written in response to a problem of offensive messages .

the command

smtp accept "gz9asd"

would remove gz9asd from the reject list.

(This feature only exists on the AmigaNOS system)

John.

Is this the ROSE PRMBS? I've never used it however it sounds
like the sysop of the PRMBS needs to define you to his box as a
'BBS'. That should stop extranious messages.

Carl.

Last I looked, the world consists of considerably more than that land
covered by the laws of the FCC... For example, anything relating to
"sale" items is expressly forbidden on packet radio in Australia.

Please, don't make the assumption that USA == world...

I recently bought the latest edition (1992-1993) of The ARRL
Repeater Directory since I have never owned one while being
a ham for 15.5 years and only being a member of the ARRL for
1 year (The first year From Feb 24, 1977 to Jan 31 1978).

This book is a disgrace! :-(Someone is not doing their job
in editing, registration of new updates, and coordination.

There are so many errors that I am sorry I even bought it now.
I would be ashamed to even have printed this if I knew what
was in it. I mainly bought it for the Packet information but
I now find that the Freq coordinators are the only ones allowed
to submit an update for the packet section and most of them
are ignoring any new updates. The freq coordinators don't want
to get involved in packet updates period from what I have seen
in the book and what I have heard. I recently send a bunch of
TCPIP packet mail to a few listed fellow hams and here is
one of the replys that I got:

---Start smtp packet mail forwarded---

Subject: Re: ARRL RPT DIR Entry
Status: O

I consider the ARRL Repeater Directory to be a lost cause. For three years
in a row I sent them current information but they refused to accept it. They
only take input from the "frequency co-ordinators". The frequency co-
ordinators don't have anything to do with packet. They don't want the
added burden of passing the information on to the ARRL for packet operation.
I was never able to get all of my entries correct. It always got scrambled
along the way. Even the one for my voice repeater on 440 is wrong. I
decided I didn't need the aggravation and forgot about it.
I don't send updates anymore and I don't buy the book. The last one I have
seen is the 1990/1991 issue. A consciencious editor would have purged the
221.01 entries. They don't seem to care whether it is accurate. Only that
it is thick enough to fetch a good price. I understand that this years
directory left out a whole area of Texas. Thanks for caring but I no
longer do. Life is too short; since my heart attack I don't let things like
that bother me anymore.

73, John

---End of Forward smtp mail---

There you have it, quoting John: "This years directory left out a
whole area of Texas." Well at least it was left out if it was
WRONG right?!?! Look at the packet listing for 220Mhz in Pennsylvania.
They still have listings below 222Mhz. What is the Editor doing
at ARRL, isn't that his job to make sure its ok? I believe the
freq below 222Mhz are nolonger ham freq correct :-).

Just wanted to let the net know about another "BUG" in the great
ARRL, INC. :-) I'll take John advice and say "Life is too short
and not let this bother me also".

73 and thanks for reading my post, I hope you've enjoyed it as
much as I have typing it :-)

As easy as it is to put up a packet BBS or such, I don't blame the ARRL
or frequency coordinators for not wanting to track the changes there.
I don't have any idea about how much staff the ARRL has for this stuff,
but I think that the repeater directory is a fine, first-order approximation
to repeater frequencies for those who are travelling.
Once you get one or two frequencies in an area, the hams can point you to
other repeaters.

Maybe some packeteers should start collecting information on packet
BBS's and frequencies for a new publication? One that could cater to
the special aspects of packet networking.

How about it?

Has anyone seen the new release of John's nodeware for the Kantronics
DataEngine?? All the BPQ version 4.06 files I have found are strictly
the PC-based program suite. John indicated that both packages were about
to be released a couple of weeks ago but I have yet to see the DataEngine
package. It was not on the Kantronics landline BBS as of a few days ago.

Confirmed sightings would be appreciated - HI!

Report and Recommendation to the ARRL Board of Directors, from the ARRL Committee on Amateur Radio Digital Communications

September 26, 1992

At the request of the ARRL Board of Directors, the ARRL Digital Committee met today with five elected representatives from the group of amateurs operating automatic HF message forwarding stations under FCC Special Temporary Authority originally dated July 7, 1987. What follows supersedes and replaces the Committee's June 13 report.

Additional data, not available at the time of the Committee's June 13 meeting, included:

A. Revised IARU Region 2 band plan resulting from the September 4, 1992 meeting in Curacao.

B. Additional feedback from amateurs at large, and the STA community, received since the June 13 meeting.

The committee is revising its previous recommendation to include fully-automatic, unattended operation on the IARU "packet priority" sub-bands and semiautomatic operation in all digital sub-bands.

IARU Band Plan

The Digital Committee, at its June 13 meeting, was concerned about frequency usage and allocation in the US. and other countries, in effect at that time.

The September 4, 1992 IARU Region 2 meeting in Curacao produced a substantially revised band plan for digital modes. The new plan includes segments on all amateur bands between 80 and 10 meters for "digital modes," defined as including RTTY, AMTOR and packet (including new systems like PACTOR and CLOVER), but not FAX and SSTV. Within those segments, "packet priority" sub-bands were defined (except on 40 meters) in which digital modes other than packet are permitted, but may not claim protection from packet. It was agreed that CW remains a permitted mode throughout all amateur bands.

The Digital Committee and STA representatives believe strongly that no distinction should be drawn -- in terms of spectrum usage -- between digital modes. Technology development is advancing quickly. Any mode could be outdated and replaced with better, more efficient

technologies at any time. Mode-specific plans will limit spectrum for development, and may reserve spectrum for modes soon to be obsolete.

For that reason, and in light of what follows, the Committee prefers the term, "automatic priority," instead of the IARU's term, "packet priority." The Committee believes the following recommendations will better align the US. band plan to the IARU Region 2 agreement.

Additional Feedback Received

There is reason to believe that many VHF and UHF operators overlooked the QST survey, assuming a "below 50 MHz" issue had little effect on them. The impact on message traffic between widely separated VHF and UHF packet bulletin boards was not immediately understood.

As mentioned in the Committee's June 13 report, every Committee member read every written comment submitted by the respondents. Those comments emphasized areas of great concern by many amateurs, and significantly influenced the Committee's previous recommendation. The concerns remain quite valid. The Committee believes new means are now available to address them, while, at the same time, enabling additional activities and developments that will benefit amateurs and the public interest.

A primary concern, among many amateurs is interference to stations under human control by stations under computer control. Except for a very few special situations, by tradition (and rule), one amateur station must not willingly or knowingly interfere with a contact already in progress, regardless of mode or the perceived importance of the communication in progress.

Semiautomatic operation has been defined by the Committee as requiring a local control operator at the calling station, to guard against interference to existing communications. The station being called operates automatically, but on a "speak only when spoken to" basis. Semiautomatic operation received a 2:1 majority (those favoring vs. those opposed) in the QST survey. The Committee interprets that response as a strong vote in favor of automated message handling, provided it can be a "good neighbor" to other spectrum users.

Initial survey respondents, while not favoring automatic operation, said (if automatic operation is permitted) they preferred sub-bands by a 4:1 ratio over any other proposed scheme. They did not favor the idea of exclusive sub-bands for specific modes.

The STA participants point to their commendable record in creating a nationwide network for moving hundreds of thousands of messages efficiently and without technical difficulties. Their efforts have lived up to Part 97.1 (a), Basis and Purpose of the Amateur Service, "Recognition and enhancement of the value of the amateur service to the public as a voluntary noncommercial communications service, particularly with respect to providing emergency communications."

Countless pieces of traffic have been transported in national and worldwide emergency situations. Messages of a "hobby" nature have been an important vehicle allowing the network to be developed and maintained in a state of readiness.

The technical effort required to construct this network, both in hardware and software technology has been considerable, and certainly meets 97.1(b), "Continuation and extension of the amateur's proven ability to contribute to the advancement of the radio art."

Thousands of bulletin board operators (sysops) and tens or hundreds of thousands of digital operators have learned to originate, relay and deliver message traffic by means not previously available. Part 97.1(d), "Expansion of the existing reservoir within the amateur radio service of trained operators, technicians and electronics experts," has also been served.

There is no question of the value provided by this message network to other amateurs and to the public at large. The Committee acknowledges the success, both technically and functionally, of the STA experiment. There have been a few reports of interference to foreign phone stations where international band plans conflict. There are few if any reports of problems with other US stations. The IARU accord minimizes or eliminates the concern for interference to foreign stations.

A major concern had remained, however, that unrestricted HF automatic operation permitted to all General, Advanced or Amateur Extra class licensees, could easily result in interference to other stations on a completely unacceptable level. Subdivision of bands by rule was previously rejected, in part because, "it will not work on a world wide basis because of the differences in the rules between regions and between individual administrations." The IARU has now provided a subdivision plan which has already met with international approval.

RECOMMENDATIONS

I. The Committee wishes to enable as many amateur licensees as possible to contribute to, and enjoy, our service. The previous recommendation stands, to permit semiautomatic operation in any digital portion of any band. This privilege will permit a variety of experimentation and operations such as personal mailboxes and MSOs to co-exist with "live" users, on a non-interference basis.

II. By using the IARU Region 2 band plan, US operation will be in compliance with international agreement. Since the sub-bands designated by the IARU as "packet priority" will offer no protection from interference to other users of that space, including US amateurs, the Committee proposes fully-automatic operation by US amateurs within those segments of the band, using any approved digital data mode. It is recommended that those segments be dubbed "automatic priority," as a more accurate, descriptive term.

III No packet priority segment was specified by the IARU on 40 meters, yet automatic networks have been operating there since the beginning of the STA. As we approach the sunspot minimum, and the MUF lowers, 40 meters will be badly needed for many propagation paths. The Committee therefor urges approval of a small automatic priority segment from 7.100 to 7.110 MHz.

Similarly, no digital segment was specified by the IARU for 160 meters. While there is little or no digital activity on this band, developing modes show promise of improving operation in this somewhat hostile (digitally) environment. The Committee feels it would be a valuable testing ground, and requests an automatic priority segment from 1810 to 1820 KHz. Specific frequencies recommended for automatic priority are listed in Appendix B

IV. The Committee cannot overemphasize our concern for protecting other spectrum users from the potential interference of automatic stations. To this end, the recommendation for automatic operation is made on the basis that protection by rule will be provided in the form of specific sub-bands to which fully automatic operation is restricted.

There is precedent for special use, by-rule sub-bands, as in 97.203(d) for beacon stations. Any other usage plans, within digital segments, should be by voluntary plan, not by rule.

The requested sub-bands should not place an additional enforcement burden on the FCC. Amateurs have always been largely self-regulating. The committee views the requested rules not as something else the FCC must spend time monitoring, but rather tools to enforce reported infractions.

V. By current standards, AX.25 is considered the least efficient protocol in use for digital modes. The STA representatives request, and the Committee wholeheartedly agrees, that AX.25 protocol be struck from 97.109(e) as a requirement, and replaced with the ability to use any accepted digital protocol.

Because the investment in technology development is large, developers hesitate to widely publish details (competitive disadvantage) in the early stages. To address this issue, it is proposed that developers be allowed the latitude to use new protocols, during the development phases, so long as they file details of the protocol, privately, with the ARRL.

VI. Because digital technologies are developing rapidly, the Committee proposes to compile, and provide to the Board, a proposal for any desirable adjustments to Region 2 band planning, prior to future IARU Region 2 conferences.

VII. The Committee reinforces its previous suggestion that the League undertake publication of a tutorial-style operator's guide for HF

digital operations clearly defining acceptable operating practices, voluntary-use band plans, DX windows and beacon frequencies.

Appendix A

The following is suggested wording for an addition to Part 97 authorizing automatic and semiautomatic digital mode operation. Note that RTTY, AMTOR, packet, CLOVER, PACTOR and future digital data modes are treated equally as "digital modes."

97.3 Definitions

( ) Unattended Digital Station - A station in the amateur service, using any accepted digital mode protocol for data or message transmission, and operated without a local control operator present.

( ) Semiautomatic operation - A two-way communication in which the control operator of a locally controlled amateur station manually initiates, monitors and controls communication between that station and an unattended digital station.

97.109 (e) No station may be automatically controlled while transmitting third-party communications, except a station retransmitting digital radio communications using an accepted protocol on the 6m and shorter wavelength bands, or on 10m and longer wavelength bands in sub-bands where automatic control is specifically authorized. The retransmitted messages must originate at a station that is being locally or remotely controlled.

97.216 Unattended Digital Station

(a) Any amateur station licensed to a holder of a General, Advanced or Amateur Extra Class license may be an unattended digital station.

(b) An unattended digital station may operate on any frequency authorized for digital transmission modes.

(c) No unattended digital station may initiate contact with another station or broadcast any undirected signal unless operating in a band or band segment where fully-automatic operation is authorized.

(d) The transmitter of an unattended digital station must be equipped with a functioning time-out timer that will insure no signal is transmitted for longer than five minutes in the event of the malfunction of control equipment or loss of contact with another station.

(e) Unless operating in a band segment where fully-automatic operation

is authorized, the control operator initiating contact with an unattended digital station must be present at the local control point. The control operator must first ascertain that no interference will be caused to existing communications, must remain present for the duration of the contact, and must discontinue the contact if it becomes evident that communications with the unattended digital station is interfering with other amateur communications.

Appendix B

It is recommended that all stations under automatic control be restricted to the following Sub-bands...

10	M:	28.120	-	28.189	MHz
12	M:	24.925	-	24.930	MHz
15	M:	21.090	-	21.125	MHz
17	M:	18.105	-	18.110	MHz
20	M:	14.095	-	14.0995	MHz
		14.1005	-	14.112	MHz
30	M:	10.140	-	10.150	MHz
40	M:	7.100	-	7.110	MHz
80	M:	3.620	-	3.635	MHz
160	M:	1.810	-	1.820	MH

(packet related complaints deleted)

While we're on the subject of ARRL Repeater Directory bashing, there's
another political bug in the directory. The ARRL has unilaterally
decided that there are only two type of repeaters: open and closed.
The other published frequency lists show three types: open, closed,
and private.

Open Anyone can use it.
Closed   Club or organization membership requested (not demanded).
Private Not soliciting for additional members.

What this has done is given some club and organization sponsored
repeaters a bad name for operating "closed" systems that are in
reality available for anyone to use.

I do not fault the ARRL for not accepting random input from any
ham with entries and corrections. I maintain a small frequency list
for the Monterey Bay area. I average one change per week. Have
pity on the poor guy at the ARRL and armtwist the frequency
co-ordination groups into supplying timely updates instead.

Here is a summary of the responses I received. Thank you to all those that
responded, and those that requested this information.

------------------------------ begin enclosure ------------------------------

From chiner@nova.gmi.edu Sat Oct 3 23:32 EDT 1992

I have one of these units, as do several friends of mine. I have been very
impressed with it, and have had no problems at all. Some features that I like:
Small size: 0.8" x 5.2" x 5.2"
low current... runs forever off a 9 volt battery.. >20 hours.
   can even turn off the leds via a software command to save more...
   draws about 10ma set up for max saving.
room inside for a 9 volt battery...
runs off any power supply between 6 volts DC to 25...
supports open squelch operation... (DCD)..
does 8bit WEFAX.
does KISS, for TCP/IP support,
has the Kantronics host mode... works with any software for the KAM...
allows complete control remotely... (if desired)

From jcv26@cas.org Mon Oct 5 13:48 EDT 1992

There was a generally favorable review in this month's 73.
No comparison to the PK-88, however.

From steve@nemesis.ksu.ksu.edu Tue Oct 6 22:31 EDT 1992

My friend, Eric (EES@KSUVM.KSU.EDU) has one. I have played with it
briefly.

It has 32K static ram.

Watchdog timer.
6809 Type processor (not TNC-2 compat)
Small footprint
Low power operation (Can even turn all LCD's off)

Kantronics 5.0 Version eeprom:

Mailbox - Reverse Forwarding
          RLI type command structure
          Remote sysop control
          Blinks STA light when mail has arrived
2 command sets - one beginner commands / one advanced commands
Software DCD (I like it, but other neters say it is worthless)
KA-Node
Host Mode
KISS Mode
All other features available on KPC-2.

I would like to add a 9600 baud modem to my PK-88. Does anyone know how
to go about doing this? I would also like to add a modem disconnect header,
will the PK-232 kit from TAPR work? Inquiring minds want to know!

Thanks in advance and 73

I have two problems with the Digital Committee's new report, one minor,
one major.

The minor one is that in their Appendix B they forget that unattended
digital stations exist above 10M. (The intent is clear from other paragraphs,
but it's not stated in this Appendix, which purports to cover "... all stations
under automatic control be restricted to the following Sub-bands...").

The MAJOR complaint is that someone has decided to remove some privileges
from Technician class licenses (I guess one understands packet better if the
code speed is >= 13wpm).

Quoted from the Report:
"97.216 Unattended Digital Station

(a) Any amateur station licensed to a holder of a General, Advanced or
Amateur Extra Class license may be an unattended digital station."

What a load of hooey! I'd like WA0CQG, Carl Estey, to present any
resaonable rationale for this line.

Look in the latest issue of the "Packet Shift Register" (the official organ
of TAPR) for details. It has blow-by-blow details for the installation
of the modem into PK88, PK232MBX, DRSI board and others.

The PK88 installation is quite elegant. It uses the unused pins in the
rs232 connector for interfacing with the tapr board which has to be in a
separate box.

Greetings,

A group of local packet users are going to set up a TheNET node. The plan
is to use the TN210 software release. Another ham told me yesterday that
there was a newer release of TheNET that also provided some incremental TCP/IP
support. He thought it was referred to as version X1G by G8KBB.

Does anyone know anything about this? If it is real, what does it by me and
where can I get it (preferably via Internet FTP)?

Thanks in advance, any pointers are greatly appreciated....

I just purchased an used Kenwood TM431: 70cm 35w mobile rig that I want
to use with the TAPR 9600 baud modem for packet. My question:

How do I interface the radio to the modem?

I have Curtis' "9600 baud packet handbook" and it mentions that
the TM431 has been used successfully with the modem.

Unfortunately, I do not have the schematic and so I would appreciate
any help that I can get.

Thanks

>Don't forget, I know hardly anything about Packet or Amateur Radio.
>Is the TNC the actual `Hardware' as such like the Packet hardware,
>and the radio setup?

Yes, that is the hardware. You connect your 500 to the TNC, run the terminal
program, and you are (in theory) ready to go. (You'll have to learn some of the
ins and outs of packet, but just monitoring is pretty easy.) I run on an A3000
and a PK-88, total setup time was about two minutes.

I'd save AmigaNOS until after I learned more about packet. It'll be easier to
set up that way.

Many moons ago I suggested adding a field like "X-Amateur-Callsign: "
to email and new articles. This would be done by hams for stuff
suitable to be forwarded automatically.

Many people pointed the obvious ease at how this could be forged. So
what. At least this is a starting point for trust and can be used to
seperate certifiable stuff from articles that are not suitable for
gateway.

It does, apart from the fact that most "firewalls" are set up to stop
protocol access, we actually require access to be controlled by
"content". It seems to me that the amateur community doesn't need to
worry about keeping incoming ftp/finger/nfs/etc requests out, but
we need to be wary of their content. [whether I like this state
of affairs is another thing altogether].

I've been doing the above crossposting of selected articles from Internet
to packet, and visa versia. for some time now. By hand. I filter out
stuff the FCC might be unhappy with by hand. I've concentrated on mod
files, but I also pass along (what is to me) interesting stuff from
sci.space and such. I estimate I crosspost about one out
of a thousand articles I see on eighter system. I suppose some sort
of corrodination might be possible (segment by topic, maybe), (like I'll
do the mod files, you do sci.space.news of interest, or such). So we
don't have redundant stuff clogging things up.

SB HFNEWS @ USA < W3IWI $DFW_REPORT
HF Digital Accord Reached in Dallas

On September 26, the ARRL Digital Committee met in Dallas with five representatives of the present HF automatic-forwarding STA networks to discuss means of continuing the benefits of the existing operational forwarding networks while protecting the interests of other users of the bands. The participants took note of the IARU Region 2 digital band plan which was adopted September 4 in Curacao. This international agreement opened the door to reconsideration of recent recommendations of the Committee to the ARRL Board of Directors.

Resulting from the meeting was a recommendation that the part of the IARU Region 2 band plan that provides for digital forwarding be incorporated into the US regulations. This recommendation will be forwarded by the Committee to the ARRL Board for their consideration as a potential petition for rulemaking to the FCC. An ARRL request for extension of the current STA for the period during which new rules are under consideration is also recommended.

In concert with the recommendation, which would both allow automatic operation and provide rules to protect nonautomatic users of the band, the participants formulated a tentative voluntary band plan for the digital parts of the MF and HF bands. Interested parties are encouraged to comment on the tentative band plan, which will be made widely available.

The participants agreed that the changing nature of the digital state of the art requires that periodic review of national and international band plans be performed. The Committee pledges to work with all segments of the digital community to suggest such changes to the band plans as may be needed in coming years.

W3IWI NOTES:
Those attending the meeting in Dallas were:
ARRL Digital Committee: W5TOO (chairman), W5SMM, WA8DRZ, AD7I & W6IWO
ARRL Board Liasion: N5TC
ARRL HQ Representative: KE3Z
HF STA Representatives: W3IWI (spokesman), W0RLI, WA0CQG, KD7XG & AD8I

The preceeding text was agreed as a brief statement of what happened. More news will follow later as the detailed report from the Digital Committee to the ARRL Board is prepared. The meeting, while intense, showed total cooperation by all the participants. The emphasis was that all the digital modes (RTTY, AMTOR, PACKET and newly developing technology) would sink or swim together and that we needed a scheme that would support orderly developments for the next 10-20 years.

The big breakthru was possible because all parties WANTED an amiable solution, and because of the development of the IARU Region 2 Digital Bandplan at the Sept. 4th meeting in Curacao.

More to follow -- 73 de Tom, W3IWI

hi,

I've just read an article about a kit, that would cost about 30 dollars to make, which gives you packet on the mac. (_73 amateur radio today_ oct '92)

in that same issue I see a small p/review (for PacComm's Baymod-9 $65) and an ad for Tigertronics's BayPac model BP-1 ($50). Does anybody have any experience with these products? Apperently, via software and by use of the computers serial line chip, the cost of getting on the air with packet is greatly reduced. I was wondering if you lose any features? as compared to say the full blown TNC's that cost over 100 dollars?

also, any pointers to other kits that can be made for under 50 bucks
or any opinions from anyone that has made or tried any of the above
greatly appreciated.

Hmmmm, I thought it was just the UK hams who ran Amiga from floppy.

I will compile a cut down version of AmigaNOS if you want..

Space Shuttle (Endeavour) STS-47
SAREX Operations from
Queensland University of Technology
Kedron Park Campus.

By Andy Joyce vk4kiv,
QUT-KP 23th Sept 1992.

- - - - - - - - - - - -

What follows is a basic overview of the planned SAREX operations with Space Shuttle STS-47 from Queensland University of Technology, and the events for SAREX with the Space Shuttle's full loss of all NASA comms via their TDRS Satellite system.

- - -

On Monday the 14th Sept a project team comprising of Mr Neville Richter lecturer from the School of Computing Science, Faculty of Infomation Technology (FIT), Dr Tee Tang lecturer from the School of Electrical and Electronic Systems Engineering, Faculty of Built Environment and Engineering, plus some project students were present in a FIT computing laboratory at the Gardens Point (city) campus of Queensland University of Technology. A TCP/IP data link (Telnet) was setup between this laboratory and a remote gateway host 10km to the north at the Kedron Park campus of QUT (vk4kiv.qut.edu.au). Also located there was the RF systems for VHF comms to the shuttle, and was manned by myself Andy Joyce vk4kiv.

This unique contact was for full 'converse' keyboard to keyboard comms from the lab at Gardens Point via TCP/IP protocols over the QUT data Network then to be re-sent automatically via AX.25 protocol on the 2m 144-148 MHz Amateur Radio band, where a special set of frequencies was selected for half-duplex comms to and from the shuttle.

As Murphy's Law says.. "A short cut is the longest distance between two points" or "There's never time to do it right, but there's always time to do it over" just about sums up the events on Monday night at our planned AOS time of contact. With NASA on one phone and an audio teleconfence link on another to the lab at Gardens point, NO contact was made !! So after many checks and re-checks we still at this point in time don't know what really went wrong. BUT knowing how much work we put into this, the SAREX team at NASA's Johnson Space Center agreed to slotting us into an unused time slot pass for one last chance for a voice only contact !! Four days later.

On Friday the 18th Sept we had re-setup all comms equipment on an unused Astromony deck at the Kedron Park campus, knowing that the pass with AOS of 08:29 UTC / 6.29pm local would also give us a magnificent opportunity of viewing the shuttle as it passed over Brisbane, as well as the planned voice comms. ** At approximately 6.20pm local we had the normal phone call from NASA's Johnson Space Center (check for readness of contact) BUT we're told that NASA would like a 'special request' for us to relay to the shuttle that "there has been a major computer malfunction at an uplink site at White Sands New Mexico, losing all comms to and from the shuttle via their TDRS Satellite system" also that "they were looking into the problem" etc... with the Shuttle crew being able to tell MCC what their plans were etc, and averting any possible confusion..... So the next 3-5 minutes was spent relaying by voice, then phone-patching audio from Mission Control Center at the Johnson Space Center, Houston Texas direct to the Shuttle via QUT Kedron Park !! The total down time of NASA's comms system was around 25 minutes, and as it just happened was just prior to our planned contact at QUT !! --> Talk about being at the right place at the right time !!

NASA restored comms with the Shuttle half-way through our pass and then gave us the all clear to go head with our planned operations. Also noting the very BRIGHT pass over are location with a 66 deg Elevation, with full voice comms, made this a very memorable contact to say the very least.

These events again demonstrate the ability of the Amateur Radio Service to providing a wide diversity of Services Supporting Educational Research and real time Communications.

I am attempting to find out about a 56kbs high speed link between Victoria and
Vancouver for packet feeds.. Have been told it is there but have not been able
to locate it. Question is , is it just a bridge to internet from packet
stations on both sides or is it a real packet link???

If anybody can help I would be very happy to gain the info

  A friend of mine has a MFJ-1270B TNC-2.. He's using it with a Yaesu FT-470 HT

and a Commodore 64. He's having a problem with the TNC and isn't sure if it's the TNC itself, or if he's doing something wrong??

  He's using a custom made cable to connect between the TNC and Yaesu.. But his Transmit Audio is VERY LOW!!.. However, when in calibration mode, the calibration tone's Audio is fine.

  I have a PK-232 TNC.. and I know that my cable that connects the TNC to my Yaesu FT-470 requires a 1K resister and a .33 uF on the Transmit line. On the MFJ-1270B they say you have to put a Jumper in JMP K on the mother board of the TNC.. (that is done!).. BUT still LOW Audio on Transmit!!.. There is a 47K resister that looks to be used on the transmit line, should I replace this with a 1 K resister???..

  Also.. His problem mightbe that his cable is wired wrong.. Anyone know the proper wiring for a MFJ-1270B -to- Yaesu FT-470 HT???

  Anyone have any ideas/suggestions on how to correct this problem??.. (Note: The Audio on Transmit is SO low that he can NOT connect to ANYTHING!!.. If you listen REALLY carefully, you can hear the data transmitted.)

  Please reply via Mail.. I don't get up here too often.. Thx!

I am looking to purchase a used TNC, preferably a 232MBX, but I would consider others. If you have such a beast for sale, in good condition, please let me know the terms/price/condition/etc via mail. I have many items I am willing to trade (SSTV camera, CAP meter, software, etc) so if you are willing to trade equiptment please specify so.

I am trying to build an AX.25 transport over which TCP/IP can be layered. I am working with SCO System V rel. 3.2 Unix, and SCO (Lachman) TCP/IP.

If anyone has any comments, suggestions, or criticisms, or knows of someone that I should be talking to before I get too far, please email me at ecudhm@erigate.ericsson.se or followup to rec.radio.amateur.packet .

Thanks,
Don

I've run into a problem with this version that I would be interested in
knowing whether anyone else has experienced.

Specifically... it is crashing. I have tested it with 3 different
Paccomm Micro-Powers, and what appears to happen is that the bank
switching signal from pin 16 of the SIO is getting loaded down and
then the whole thing bombs. This is a guess based on the loss of the
flickering STA led, and a total lack of response from either the HDLC
or serial port.   Need to put a scope on it, but have not done so yet.

This symtom seems to occur right after a coldstart SOMETIMES. When you
turn the tnc on, the sta led comes on solid, starts to flicker, gives
one bright "flick" and then dies... other times, you get the same thing
but after the bright flick, it continues to run. This may in some way
be related to the specific tnc (??) and not the code itself... at this
point it is hard for me to say.. but I'd be curious to know if anyone
else has seen it.

Thanks,

Mark Bitterlich

I've had TheNet X1G up for going on 90 hrs now, and have not had a single
problem. It is, however, running in an MFJ-1274. There is plenty of
traffic thru it too, as the stats show an average DCD of => 65%. Sounds
like it doesn't like the PacCom :(

No joy. Any foole can forge moderated postings. The buck, as always, stops
with the gateway operator.

As for SB/EX formatting: just what kind of archaic software are you running?
Those aren't NNTP commands :-)

Giving someone a false sense of security will only get them into trouble.
Program a neophyte gateway operater to think that "X-Amateur-Approved"
is OK then he probably will. That won't do anything to save his ass when
this posting makes it through the gateway.

Wishful thinking is not reality - don't confuse the two. If you really
want to do something productive, start by looking at technology such as
public key authentication.

As a sidenote to those talking about writing "naughty bits" filters, how
many of your filters will catch something like "merde merde merde" from
getting through? The whole world doesn't speak english. You're going to
have to come up with some pretty impressive AI software to catch these
naughty bits in french, german, croatian, cantonese, etc., in addition
to english.

Hi there!

I wonder, is there a source code for the AX.25 protocol (One that handles
the communication as automatic as possible) ?
I'm building a computer, and I would like to have the packet radio
capability in the computer. I have the HDLC/X.25 USART that one needs to
to get put X.25 data on the air, but I need the software to generate,
process and handle the data that's going on and off the air...
Any source that can handle the latest revision of AX.25 (The last I heard
of was V2.0) to 100% is what I have in mind...

              73 de SM0TVI / Teodor V.
E-Mail: teodor@proxxi.se

Please mail source or any ftp site to me directly, I don't read
this newsgroup so often.

It is a familiar story.

>I estimate I crosspost about one out of a thousand articles I see on
I am more around 1 in 15 or so at times.

The problem here is determining what is interesting. Also, you tend to
post replies rather than original questions so the ability to digest
and edit is important. If not, then complaints start filtering through
that you are the cause of the overload on the packet system :-)

Maybe the key here is to have this moderated data, many of us still will
not trust it, but at least the ratio of data that makes it through can
be higher.

>of corrodination might be possible (segment by topic, maybe), (like I'll
>do the mod files, you do sci.space.news of interest, or such). So we
>don't have redundant stuff clogging things up.
The problem is that the best the amateur community can do for segment
by topic on USENET is to have r.r.a.misc, r.r.a.packet making it a
nightmare trying to figure out who is responsible for which topic.
Still sounds like we need a small group of people dealing with this,
setting up BIDs and format standards for the information so that it
can be handled efficiently.

Do we have any volunteers to take on the job of running a moderated

group/mailing list that would be willing to colate the editorial
works from several individuals (duties will be stomping on duplication,
generating unique BIDs, ensuring articles are broken into 4K or so blocks,
taking **** from individuals that feel your editorial decisions are bogus,
or from making mistakes in judgement by missing a swear or two :-)).

The various groups of interest that should be handled:
     ARRL and other bulletins:
          - Keps
          - DX
          - propogation
          - ARES/RACES
          - SAREX
          - Ham Fest announcements
     Solar Reports (already handled by Cary Oler at the moment, you
               too can be on his mailing list ...)
     Mod information and tech reports
     Reviews
     New ideas:
          - new circuitry and ideas
          - packet protocols
     Short wave reports
          - SCDX
          - schedules
     Messages from packet
     Others?

I'd volunteer, as editor, but first I will have to talk to my network
neighbors first, as I am a hitchiker, to determine what they feel about
the load I will be producing ... Also, I suspect my current MX record
will be changing again shortly ... :-(Anyone more suitable willing to
volunteer to be this clearing house?

We also should have volunteers to handle the subset information (there already
are several of you out there already doing this, and you know who you are)
and do some format adjustment perhaps as well as making sure content is
OK.

Ciao, 73 de VE6MGS/Mark -sk-

I just purchased a Kantronics KPC3 low power TNC which I intend to use with NOS (wg7j104), a FT-470 and an HP95LX for a fully portable TCP/IP station.

In setting up the KPC3 for TCP/IP I found what I believe is a major 'bug' in the firmware (5.0). The unit is designed to maintain the current mode through power cycles. If, while in KISS mode, you send a param command to set txdelay (param <iface> 1 xx) or slottime (param <iface> 3 xx) the unit will perform a hard reset upon the next power cycle.

There is a work around, however, simply set these two parameters while in the TERMINAL interface mode and then switch to KISS mode. (Remember to remove the param statements from your autoexec.nos file, the first couple of time I didn't. :-) I also set persistence in the TERMINAL mode.

This info has been placed on the Kantronic BBS.

How does that work? Is the data broadcast on FM subcarrier? Is the
company still in business?

Try a faster eprom. It worked just fine here and when I burned a slower
eprom I had the exact same symptoms. I think I know have a 27512-2 (Intel)
and it works fine in the MFJ-1270b. There is also a THENET X1F node that
we're running since that version was out in a Paccomm Tiny 2 and it hasn't
locked up yet.

Why not just run news on the radio using TCP/IP?
In Japan we've running it for more than 2 years and no technical problem
arises - we made it USENET-compatible and we use SMTP to encapsulate
news articles. Period.

W0RLI or WA7MBL or whatever (no offense intended to the authors) BBS
software packages are just JUNKS considering connecting them to
other networks. While legal issues still remain, I think there's no
reason why hams have to use those archaic incompatible programs.

Every time I see proposals of "censorship" or "moderated gateway" I
get disappointed. Isn't ham radio for cyberspace pioneers?

Mark,
  You might lift pin 16 of the SIO and wire to it in free space. Then
  the load will be only one device. I've been jumpering pin 16 and 23,
  and pins 24 and 25 on the SIO while lifting pins 16 and 25. This
  causes the STA and CON lights to show RS232 control line activity
  for matrix diagnostics. Pin 16 and 25 are free for wiring too now.

I am using a Baypack BP-1 on an old (very old) Phillips Ibm compatible
without problems. My radio is an Icom Ic-w2a.

Lines: 24

Hi all,

I have an FT 470 which I wish to use with my PacComm Tiny-2 for packet
radio use. So far I have managed to connect the radio to the TNC and

am able to connect to only a few stations. When I monitor my own transmitted audio on a scanner, the audio is at a very low level in comparison to that of the other radios I use for packet.

My TNC is connected directly to my FT 470 without any special interfacing and I think that it needs some interface to provide audio at the correct level for the FT470.

Has anyone an experience in interfacing the FT 470 to a TNC, if so I would be grateful for details of how you went about it. Thanks in advance !!!

GB2RS NEWS BROADCAST

Good morning. It's Sunday the 4th of October and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

This week we have news for Jamboree on the Air stations, microwave

enthusiasts, repeater keepers and RSGB members in Shropshire; plus all the usual DX, contest, rally, propagation and club news.

The 35th Jamboree On the Air takes place over the weekend of Saturday the 17th and Sunday the 18th of October. Scouts and Guides all over the world will be using amateur radio to celebrate their shared interest. Any participating group may obtain a full list of JOTA stations by sending a large Self-Addressed Stamped Envelope to Sylvia Manco, RSGB, Lambda House, Cranborne Road, Potters Bar, Herts, postcode EN6 3JE.

The next RSGB Microwave Round Table meeting has been arranged for Sunday the 18th of October. This meeting is the scheduled Autumn event of the Southern series, now held at a range of venues across the south of England. The venue is the Flight Refuelling Amateur Radio Society Club, Wimborne, Dorset, which is signposted from the Wimborne by-pass. The meeting will start between 10.00 and 10.30am. It will feature an open forum; items under construction and complete stations; a bring and buy sale; a calibration and alignment session, and a short presentation. Further details can be obtained by telephoning Ted Jewell, G4ELM, on 0730 892462

All RSGB members should by now have received October's Radio Communication. There are several items concerning licensing: The attention of those in charge of speech, RTTY or TV repeaters is directed to the article Repeater Franchise Update on page 8. This deals with the Letter of Authority to Operate, valid until the 31st of March 1993. Repeater groups who need this letter will receive it soon. The only group which will not receive this letter is GB3BM. We apologise to the GB3GC group who were incorrectly listed in the RadCom article as not having responded. Page 6 of the same edition invites comments on a proposal to introduce Aeronautical Mobile into the UK Amateur Radio Licence. Also on page 6 is a request for data from VHF operators to assist the RSGB in preparing its submission to the Spectrum Review being carried out by the Radiocommunications Agency.

Attention RSGB members in Shropshire:

The new RLO for Shropshire is David Whalley, G4EIX, whose address is: 1 Lees Farm Drive, Madeley, Telford, Shropshire. His telephone number is 0952 588878.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Turks and Caicos,the Turks and Caicos Amateur Radio Society will sign VP500CC from Friday the 9th to Monday the 12th of October from Grand Turk to commemorate Columbus's landfall on that island 500 years ago. From Swaziland, a group of UK amateurs will sign 3DA/G3SXW, 3DA/G3TXF and 3DA/G4FAM from Saturday the 10th to Sunday the 18th of October. They will cover the nine HF bands 160 to 10 metres using CW only. Special effort will be made to use grey-line LF openings into Europe. Sunrise time is 0320 GMT and sunset is 1600 GMT. Check these frequencies:- 1833, 3503, 7003, 10103, 14023, 18073, 21023, 24893 and 28023 kHz. They will listen between one and two kilohertz HF. From Minami Torishima, JA1KJW will be active as JA1KJW/JD1 from Iwo Jima from today until the 14th of October, on the 80 to 10 metre bands.

Rally news now, and we know of three events for today Sunday the 4th.

The Blackwood and District Amateur Radio Society Rally is being held at the Oakdale Community College, Blackwood, Gwent. Doors open at 10.30am and the event features traders, a bring and buy. Talk-in is on channel S22. The Great Lumley Radio Rally is being held at the Community Centre, Great Lumley, Nr Chester-le-Street, County Durham. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy, and refreshments are available. The Wincanton Radio and Electronics Rally is being held at the Wincanton Racecourse, Somerset. Doors open at 10.00am and the event features trade stands, car boot sale and refreshments will be available. Talk-in will be on channel S22.

There are three events for next Sunday the 11th of October.

The Armagh and Dungannon and District Amateur Radio Society Rally is to be held at the Gosford House Hotel, Markethill, County Armagh. Doors will open at 12.00 noon. The event features the usual traders, a bring and buy and refreshments will be available. Talk-in is on channel S22. Further details can be obtained from GI8RLE, by telephoning 0762 870423.

The Hornsea Amateur Radio Club Rally will be held at the Floral Hall, Hornsea, North Humberside. Doors will open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy. Further details can be obtained from G4IGY, by telephoning 0964 533331.

The South Devon Radio Club's 'Computercation 92' Computer and Radio Rally is to be held at the Hillhead Camp Site, Dartmouth Road, Brixham, Devon. Doors will open at 10.00am and the event features trade stands, car boot sale and refreshments. Talk-in will be on channel S22 via GB4CPU. Unlimited free parking and overnight camping. Further details can be obtained from G6ZRM by telephoning 0803 522216.

Next some dates for your diary.

The Conference of the World Association of Christian Radio Amateurs and Listeners will take place on Friday the 9th to Sunday the 11th of October, at the High Leigh Conference Centre, Hoddesdon, Herts. Further details are available from G4EZU, by telephoning 0474 533686. The Leicester Amateur Radio and Electronics Exhibition will take place at the Granby Halls, Aylestone Road, Leicester, during Friday the 23rd and Saturday the 24th of October. See the centre pages of October's RadCom for further details.

HF Contest news now:

During Friday the 9th of October, the next leg of the RSGB QRS Cumulative Contest will take place. This event features slow Morse and further details can be found in July's RadCom. Next weekend, Saturday the 10th and Sunday the 11th, sees the VK-ZL CW Contest. September RadCom page 14 has further details. Also next Sunday the RSGB's 21/28MHz Telephony Contest will take place between 0700 and 1900GMT. See April RadCom page 66 for further details.

Next the VHF/UHF Contest news:

The next RSGB event is the 1.3 and 2.3GHz Cumulative next Tuesday the 6th of October. It runs from 1930 to 2200GMT and June RadCom has further details.

And now the solar factual data:

This week we cover the period 21st to 27th September. Although the quiet side of the sun was looking our way with no flare activity of any note, the spot numbers and solar flux levels hardly changed. Despite this, ionospheric levels rose and HF band conditions considerably improved up to the best for over a year. Sun spot counts have been reasonably steady and meaned around 107. The solar flux levels slightly rose over the week and averaged 114 units but the day-to-day variations were very small. The geomagnetic Ap indices have been basically quiet most of the time and averaged 7.5 units, though the 24th and 27th were down to only 3 units - very quiet. The state has been nil, nothing to report, throughout the period. The radio quality indices improved up to excellent, with the Fort Collins and Tokyo circuits being extremely good. The Moscow circuits were the poorest but even so, they were above normal all the period. The aa indices, as supplied by the British Geological Survey for the period 15th to 21st September, gave a daily average of 31.6 nanoTeslas. However, the 17th was very disturbed with some aurora, and levels averaged 91.9 with periods up to 136 nanoTeslas.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 9.1MHz with levels hardly changing day to day. Peak level times are now about 1400 hours. The darkness hour lows averaged 2.7MHz but there have been some periods when the ionosonde was unserviceable.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 8.0MHz and the darkness hour lows 2.9MHz. The Ap estimated planetary Ap index which is given in GB2RS data is derived from magnetometers at College, Alaska; Goose Bay, Newfoundland; Loring, Maine; Boulder, Colorado and Upper Heyford, UK.

And lastly the solar forecast:

This week, the more active side of the sun will be looking our way and solar flux levels are expected to be about the 120s. Geomagnetic activity is expected to be mainly unsettled to quiet levels. Ionospheric MUFs during daylight are expected be about 24MHz. and the darkness hour lows 18MHz, with 14MHz being best for east/west contacts around midnight.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S M and G7 N T series, and Novice calls in the 2 0 A D and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

lyndon@unbc.edu (Lyndon Nerenberg) sez:

>No joy. Any foole can forge moderated postings. The buck, as always, stops
>with the gateway operator.
Actually, there is joy. I doubt any self respecting fool would let ANY
message (- SOLAR reports :-) go through automatically, but it would be nice
if one can feel that the article has been poured over by at least one
individual `possibly' to make the duties of us crazed enough to read all
the articles in r.r.* groups just to find the tidbits ... Many have
(personally) indicated they would prefer a mailing list (also forgeable,
but at least out of sight, out of mind).

>As for SB/EX formatting: just what kind of archaic software are you running?
>Those aren't NNTP commands :-)
I may take this as a personal attack :-) My gateway has always offered
flow through sans the SB/EX stuff with even some imaginative BID handling
for packet. Now if I were only in an area that had packet connectivity :-}
The advantage of this format is any joe that wished to gateway articles need
only feed the article verbatum via his terminal emulation package and he be
fine !?

Now, if that were an attack on the packet system, well, what can I say ...
Maybe we set up the articles to look like SMTP messages to the packet board?

OK, and X-Amateur-Bid: I hope too, forgot the details, but I remember the suggestion.

> Many people pointed the obvious ease at how this could be forged. So
> what. At least this is a starting point for trust and can be used to
> seperate certifiable stuff from articles that are not suitable for
> gateway.
I agree, but I can wonder out loud that we may not be saving the dedicated gateway operators any trouble as they will read everything and pass nothing ... (It won't for me).

But, then Lyndon/VE7TCP sez:

>Giving someone a false sense of security will only get them into trouble.
>Program a neophyte gateway operater to think that "X-Amateur-Approved"
>is OK then he probably will. That won't do anything to save his *** when
>this posting makes it through the gateway.
I doubt, with the regulations in W or VE land, that we will EVER see automated news to packet gateways (mail to packet `maybe' with some form of authentication). I think that the only way this will happen is for someone to gateway the messages and then forge their own address :-}

>Wishful thinking is not reality - don't confuse the two. If you really
>want to do something productive, start by looking at technology such as
>public key authentication.
On packet ... against the regs ... carry this to r.r.a.policy or private e-mail if you disagree.

Over usenet (news) HAH! I'l make a naughty article, and Approve it for
distribution by acknowledging any encrypted authentication responses
and make you extremely happy.

>As a sidenote to those talking about writing "naughty bits" filters, how
See my Summary:

I think, Lyndon, you are too pessimistic about what people are capable of.
But I agree somewhat with your criticism if you (or others) could point to
a good RFC for doing this `safely'.

Lets say the mail list message goes out, then a authentication message goes
back (we are assuming that many of the gateway operators are NOT directly
on the wire, so e-mail level authentication), and then the message goes onto
packet. I'l lay odds the delay would be up to two days (as the moderator
would also have to read it to ensure it is OK, and he works regular hours).
`SOLAR STORM WARNING THIS AFTERNOON, HIDE UNDER SHEETS UNTIL 3PM TODAY'

My offer is still open to run a mailing list to the gateway operators that
want to start up this service. Send me e-mail indicating which messages of
interest you would be willing to clear for the community, or if you are
interested in receiving a mail list feed. I'l see what happens ...

Does anyone have any comments (good or bad) about the Kantronics
3 TNC? This is the one that is VHF+ and retails for ~$100.
A comparison to a PK-88 would also be helpful. If I get enough
replies I will summarize to the net.

Thanks.

I have a PK-232 problem (I am in contact with AEA, but would like a second opinion):

I just installed the latest ROM upgrade and added the MBX maildrop. If I post several (more than one) messages to my maildrop for reverse forwarding, the polling/receiving PBBS, KB1BD-4, gets a "Bad" from me and disconnects. Thus it picks up one message at a time.

The BBS is running the latest version of PRMBS. According to AEA (who asked me to send a log that showed the problem) the BBS sends an acknowledgement in the form of "RCVD #nnnn...." and AEA says it should only be sending me "F>" and nothing else. AEA says "Tell the sysop to suppress that message." KB1BD says "No can do. No one else has this problem..."

Anyone know any workarounds? Thanks, in advance. 73, Gerry

P.S. What software are you using folks that puts all those >>>>> in front of the quoted stuff? Gotta be automatic, no?

Just asking who is running wampes ?
Im just getting sorted out with it .. just to test.. First thoughts are its
a bit Antiquated compaired to WNOS ok very stable but much out of touch
with the latest tech.. PM-NOS is nice But it has not got an AX25 Autorouter
it seems to use the NetRom which is dead in these parts.
Ok if there is any one with wampes and you have any config tips hints
and doc's can you please post them ... I know the wampes author is not
likely to ever make even the simplest install guide, well thats life. ah!
anyone got any helpfull info then ??
barry.

That would be great!! There are a lot of amigas out there that only run
on a meg.. I am going to the local Ham meet this coming Monday and
I will see if someone can help me with tutoring to get me started...

Cheers, and 73's (is that right?)
Maybe someone could post a list of Ham grrets.. :-)

Cheers,
Grant

> compared to say the full blown TNC's that cost over 100 dollars?

First of all, you lose the ability to turn off the computer and let the
TNC operate as a digi, mailbox, etc. As the computer does all the bit
manipulation in the Baycom/Poor Man's Packet (software TNC) method, you
need your computer on, and running the software, to be able to do
anything at all on packet.

All stand-alone TNCs can do some operations without a host computer;
namely, digipeat other signals, and can be used with a "dumb" terminal
(something I'm doing now... the computer is obviously being used to
reply to you...). The newer TNCs also have a "mailbox" function which is
essentially a mini BBS. All these functions are built into the box.

Is it worth the extra $50-$75? I think so; you might not.

Um, begging the Colonel's pardon, but this is way off base. Just because
Bob was nice enough to give us a window in on some commercial code he was
writing for a product that would interest most of us here, doesn't obligate
him to providing full free support of said software over the net. Especially
when the commercial relationship ends.

Before anyone goes crazy about this, someone should say definitely
that the fines really happened or they didn't. For example, *I*
heard that most of the hams cited replied to a pink slip and that was
the end of it - no fine. But I don't know if that's true either.

There is plenty of good packet software available for Amiga's. The AmigaNOS
software for the Amiga is much easier to use, being multiple windowing, and
multitasking, than the PC versions. AmigaNOS is a robust version of the
TCP/IP
based KA9Q internet software, and includes support for SLIP connections,
newsmailer, and many, many other features. Also there are some good PD term
programs, if your not up for tackling TCP/IP packet quite yet.

Over the last 2-3 years, users of LAN-LINK have been asking me all sorts

of questions about packet radio. The questions range from basic topics
to advanced topics.

Well, I've documented the answers in a book "Basic Packet Radio" which I'd
like to get out and about.

So to all club officers, here's an offer you can't refuse.

If you send me a recent copy of the club newsletter, I'll send you a copy
of my new book on BASIC PACKET RADIO. Use it for review, as a door prize or
inclusion in the club library.

I'll add details of the discount offer for clubs <HI>.

The book (384 pages) covers:

What packet radio is.
What it takes to use it.
The Local Area Network.
The PBBS and how to use it.
how to send and receive messages and bulletins.
The distributed LAN.
Extending your range via Nodes.
PacketClusters.
Dumb servers and smart servers
ELMER - the ham's expert system
LAN-LINK Manual.

Send to POB 3419, Silver Spring, MD. 20918.
73 Joe

Hi there,
     I have an AEA PCB-88 installed on my 386sx based PC as COM3:
The PCB-88 is basically a PK-88 on a PC board. I think it must even use
the same ROM software, as it signs on as a PK-88.

What it lacks is a set of LEDs, in particular the one I would like to have
is the yellow "status" LED. I borrowed a TINY-2 before buying this TNC, and
on the TINY-2 it was used to indicate if there were unacknowledged packets
and also if there was mail waiting in the PMS. I wonder if anyone could
tell me how to remotely rig up some LEDs to the board.

Second question, what are the four dip switches on SW2 used for? The manual
only explains the use of SW1 to set up which COM port it resides on.

Thanks in advance for any response,

Paul

I've got a PK88 and a navico radio which have been plodding happily onwards
and I'm now looking at trying playing around with faster buad rates. The
PK88 can be set to 2400, 4800 , 9600 and 19200 baud. Now I don't expect
a PK88 to do 9600 or 19200 happily, but I'm curious what experience
people have had trying to run a PK88 at 2400 and 4800 baud.
Also what are people's best opinions on a 9600 baud modem, preferably
one I can run parallel to the PK88 on the same frequency, and run from
a PC.

I too operate an Internet e-mail gateway. It handles Email traffic to and from
the Internet, UUCP, and the local packet community. It also feeds the 'rec.
radio.amateur.packet/misc/policy' newsgroups into the local packet system. I
make 'reasonable' measures to keep the traffic within the spirit of the law,
but I certainly won't go overboard. It's all automated, reviewed by computer
and I certainly don't personally read everything. As far as I'm concerned
this should be all that's necessary. If something wrong does happen, I'll take

my lumps, explain how it happened and fix the program to not allow it next time.

Progress isn't made by assuming the worst will happen.

No guts, No air medals.

The incident happened on January 5, 1991, and was started by an alleged
message originated by Joe Reed (WA3QNS) of Norristown, PA. The message
asked recipients to phone a 900 number to register opposition to the
Persian Gulf War. The message was filed at the BBS of Rolf Jespersen

(N3LA) in Spring City, PA. Within days of the incident, J.J. Freeman, 2nd, director of the Norfolk, Va., office of the FCC slapped fines of $300 on three operators (N3LA, WA3QNS, and, I believe, W3IWI). Mr. Freeman was made aware of the apparent violation of the FCC rules by U.S. Navy Captain Russell Tjepkema of Virginia Beach, VA., whose amateur call I don't remember.

The end result was -- Joe Reed pleaded innocent of the charges, claiming someone was pirating his call -- The stations cited replied to the letters and the fines were withdrawn. Also 8 or 9 other stations in the forwarding path received writted warnings from the FCC.

Dear friends,

I would like to buy new (for me) TNC. I am interested in new equipment or preowned as well. So if you have any TNC for sale, if you know someone who would like to sell one, let me know about it please! Every offer could appear interesting! Maybe you know shop which is worth to recommend? Every remark is welcome! Thank you in advance,

addresses:
kfeeney@helios.tn.cornell.edu (address known good as of March 1992)
payne@theory.tc.cornell.edu

The software was available from the 73 Magazine BBS at (603)525-4438 in the 73 MAG SIG at the time the system was described in 73 (August 1991).

The primary source for FTP access is helios.tn.cornell.edu. It is probably also available at major ham radio ftp sites such as ucsd.edu and wsmr-simtel20.army.mil

As of October 1991 Feeney could supply a chip/crystal pair for $24 and a blank PC board for $7 (specify home or laptop version). The software, including source code, was available for $10 on disk ($5 with the hardware). A kit of additional parts was $10. You should contact him for current details at:

F. Kevin Feeney, 468 Hines Rd., Newfield NY 14867.

Gates like the one I use (N0ARY) let me read the packet BBS stuff
via the InterNet....via List and Read commands...some very interesting
stuff (from AMSAT, on conferences, etc. is in there that I don't otherwise
see.... For the price of that very easy no-code license one can take
advantage of packet even w/o a radio...really a great set-up (THX N0ARY!)
and now I'm hot to get set up on portable packet myself...maybe instead
of setting up a new packet.foo group we should just get people to get the
tech license and try the packet gateways to get their feet wet ... just
my 2 bits...

Yeah, but they dropped the fines. Or did everybody forget about THAT part?
Getting a NAL is not the same as paying the fine. (Once you heart restarts.)
The people that responded (key word) to the FCC had thier fines dropped.
The alledged originator swore up and down that he DID NOT originate the
message that it must have been someone using HIS CALL, and was NOT fined.
The few that had to pay (and this was more for failing to properly answer
the NAL) were fined $300. The issue never really did get resolved properly,
but like so many other things, the media hype and attention died down and
things went back to business as usual.

I run an internet e-mail gateway (hand operated, nothing fancy) for the
occasional user that wants to have access to this media (and vice versa).
I trust my users are intellegent enough to not want me to show up at 3:00
AM in the morning with a NAL in one hand and a 12 gauge in the other. Most
of the work, checking, labor involved is seeing to it that things are sent
correctly, not what is sent.

Things happen, nobody's perfect and the FCC understands this. They just want
the Licensee to take reasonable measures to keep things in line. And for when
something wrong does happen, to take the effort to explain how it happened and
what steps will be taken to preclude it from happening again.

A friend of mine has a MFJ-1270B TNC-2.. He's using it with a Yaesu FT-470 HT and a Commodore 64. He's having a problem with the TNC and isn't sure if it's the TNC itself, or if he's doing something wrong??

He's using a custom made cable to connect between the TNC and Yaesu.. But his Transmit Audio is VERY LOW!!.. However, when in calibration mode, the calibration tone's Audio is fine.

I have a PK-232 TNC.. and I know that my cable that connects the TNC to my Yaesu FT-470 requires a 1K resister and a .33 uF on the Transmit line. On the MFJ-1270B they say you have to put a Jumper in JMP K on the mother board of the TNC.. (that is done!).. BUT still LOW Audio on Transmit!!.. There is a 47K resister that looks to be used on the transmit line, should I replace this with a 1 K resister???..

Also.. His problem mightbe that his cable is wired wrong.. Anyone know the proper wiring for a MFJ-1270B -to- Yaesu FT-470 HT???

Anyone have any ideas/suggestions on how to correct this problem??.. (Note: The Audio on Transmit is SO low that he can NOT connect to ANYTHING!!.. If you listen REALLY carefully, you can hear the data transmitted.)

Please reply via Mail.. I don't get up here too often.. Thx!

Zoltar and WO9K,

You can get started quite well with only a TNC and a terminal program.
AmigaNOS is great (I have it), but it takes a lot of space, so
1 meg of memory might not be sufficient in some cases (depending on
what else you're doing at the time). Also, a hard drive is
indispensible for AmigaNOS.

Depends on your desire and budget, Zoltar.

Space Shuttle (Endeavour) STS-47
SAREX Operations from
Queensland University of Technology
Kedron Park Campus.

By Andy Joyce vk4kiv,
QUT-KP 23th Sept 1992.
- - - - - - - - - - - -

What follows is a basic overview of the planned SAREX operations with Space Shuttle STS-47 from Queensland University of Technology, and the events for SAREX with the Space Shuttle's full loss of all NASA comms via their TDRS Satellite system.

- - -

On Monday the 14th Sept a project team comprising of Mr Neville Richter lecturer from the School of Computing Science, Faculty of Infomation Technology (FIT), Dr Tee Tang lecturer from the School of Electrical and Electronic Systems Engineering, Faculty of Built Environment and Engineering, plus some project students were present in a FIT computing laboratory at the Gardens Point (city) campus of Queensland University of Technology. A TCP/IP data link (Telnet) was setup between this laboratory and a remote gateway host 10km to the north at the Kedron Park campus of QUT (vk4kiv.qut.edu.au). Also located there was the RF systems for VHF comms to the shuttle, and was manned by myself Andy Joyce vk4kiv.

This unique contact was for full 'converse' keyboard to keyboard comms from the lab at Gardens Point via TCP/IP protocols over the QUT data Network then to be re-sent automatically via AX.25 protocol on the 2m 144-148 MHz Amateur Radio band, where a special set of frequencies was selected for half-duplex comms to and from the shuttle.

As Murphy's Law says.. "A short cut is the longest distance between two points" or "There's never time to do it right, but there's always time to do it over" just about sums up the events on Monday night at our planned AOS time of contact. With NASA on one phone and an audio teleconfence link on another to the lab at Gardens point, NO contact

was made !! So after many checks and re-checks we still at this point in time don't know what really went wrong. BUT knowing how much work we put into this, the SAREX team at NASA's Johnson Space Center agreed to slotting us into an unused time slot pass for one last chance for a voice only contact !! Four days later.

On Friday the 18th Sept we had re-setup all comms equipment on an unused Astromony deck at the Kedron Park campus, knowing that the pass with AOS of 08:29 UTC / 6.29pm local would also give us a magnificent opportunity of viewing the shuttle as it passed over Brisbane, as well as the planned voice comms. ** At approximately 6.20pm local we had the normal phone call from NASA's Johnson Space Center (check for readness of contact) BUT we're told that NASA would like a 'special request' for us to relay to the shuttle that "there has been a major computer malfunction at an uplink site at White Sands New Mexico, losing all comms to and from the shuttle via their TDRS Satellite system" also that "they were looking into the problem" etc... with the Shuttle crew being able to tell MCC what their plans were etc, and averting any possible confusion.....
So the next 3-5 minutes was spent relaying by voice, then phone-patching audio from Mission Control Center at the Johnson Space Center, Houston Texas direct to the Shuttle via QUT Kedron Park !! The total down time of NASA's comms system was around 25 minutes, and as it just happened was just prior to our planned contact at QUT !! --> Talk about being at the right place at the right time !!

NASA restored comms with the Shuttle half-way through our pass and then gave us the all clear to go head with our planned operations. Also noting the very BRIGHT pass over are location with a 66 deg Elevation, with full voice comms, made this a very memorable contact to say the very least.

These events again demonstrate the ability of the Amateur Radio Service to providing a wide diversity of Services Supporting Educational Research and real time Communications.

I am attempting to find out about a 56kbs high speed link between Victoria and
Vancouver for packet feeds.. Have been told it is there but have not been able
to locate it. Question is , is it just a bridge to internet from packet
stations on both sides or is it a real packet link???

If anybody can help I would be very happy to gain the info

Sender: usenet@gate.demon.co.uk

Good morning. It's Sunday the 27th of September and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- UoSAT 22 helps with hurricane emergency in Hawaii; HF
Field Day headlines; City & Guilds fee increase.

From information received from AMSAT-UK Satellite UoSAT22 is providing a great
humanitarian service right now in connection with the hurricane disaster in
the Hawaiian Islands. It is probable that this is the first time that a PACSAT

is being used for Health and Welfare traffic and many messages have been transmitted via UoSAT22 using the HF BBS network. The whole UoSAT team are to be congratulated on this achievement especially when, during the middle of the night, a call to Ron Broadbent, G4AAJ, managed to get the satellite operating again after a breakdown in communication links.

Next the results of the RSGB HF SSB National Field Day which took place during the first weekend last June. The Open Section was won by the Reading and District Amateur Radio Club, G3ULT/P with 5328 points and runner-up was the Plymouth Radio Club, G3PRC/P with 4805 points. The Restricted Section was won by the Gravesend Radio Society, G3GRS/P, with a score of 5121 points, with the Red Dragon Contest Group, GW8GT/P, as runner-up with 4943 points. The QRP Restricted Section was won by the Adur DX Club, G4BUE/P, with 2801 points, with second place going to the Echelford Amateur Radio Society, G3UES/P, with 2556 points. Overall 93 groups entered for the contest. Congratulations to all concerned. The full results will be published in Radio Communication just as soon as space permits.

City and Guilds Centre Registration fees are going up by 100% as from the 1st of October 1992. All Clubs wishing to register as a City and Guilds Examination centres for the Novice Radio Amateur Examination and the Radio Amateur Examination need to get their application requests into City and Guilds before the end of September.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From China, F6FYA and FD1SQM will use the club station BY1BJ on the 2nd, 10th and 31st of October, and also during the CQWW SSB and CW Contests. From Market Reef, members of the DX contest Club OH1AF will sign OH1AF/OJ0 on all Bands and Modes, including WARC, RTTY, 6 metre and OSCAR. Activity to start around the 7th of October for one week. From Marshall Islands, AH6IO and NH6UY will sign V73IO and V73UY respectively from tomorrow, Monday the 28th to Thursday, the 8th of October on all bands from Bikini Atoll. From Sri Lanka, G3VLX hope to be active as 4S7DEG from the 7th to the 31st of October, on 40 to 10 metre bands, but not WARC, using mainly SSB.

Rally news now, and we know of two events for today Sunday the 27th.

The Harlow Amateur Radio Rally is being held at the Harlow Town Sports Centre, Hammarskjold Road, off Fifth Avenue, Harlow. There is easy access off the M11 Motorway at junction 7, the A414. The venue is signposted from this location. Doors open at 10.30am and the event features traders, large bring and buy and special interest groups. There is on-site parking with full facilities for disabled visitors and refreshments will be available. Talk-in by G6UT is on channels S22 and SU22.

The North Wakefield Amateur Radio Club Radio Rally is being held at the Outwood Grange School, Potovens Lane, Outwood, Wakefield. The school is located one mile from Junction 41 of the M1 and M62 Motorways. Doors open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy stall and repeater group and Novice stands. Refreshments are available. Talk-in by G4NOK will be on channel S22.

There are three events for next Sunday the 4th of October.

The Blackwood and District Amateur Radio Society Rally is to be held at the Oakdale Community College, Blackwood, Gwent. Doors will open at 10.30am and the event features traders, a bring and buy. Talk-in is on channel S22. Further details can be obtained from GW0MAW by telephoning 0495 227550.

The Great Lumley Radio Rally will be held at the Community Centre, Great Lumley, Nr Chester-le-Street, County Durham. Doors will open at 11am, 10.30am for disabled visitors. The event features trade stands, a bring and buy, and refreshments will be available. Further details can be obtained from G1JDP by telephoning 091 388 5936.

The Wincanton Radio and Electronics Rally is to be held at the Wincanton Racecourse, Somerset. Doors will open at 10.00am and the event features trade stands, car boot sale and refreshments will be available. Talk-in will be on channel S22. Further details can be obtained from G4YXX by telephoning 074985 432.

HF Contest news now:

During Thursday the 1st of October, the next RSGB QRS Cumulative contests will take place. These events feature slow Morse and further details can be found in July's RadCom.

During next weekend, Saturday the 3rd and Sunday the 4th, the VK-ZL SSB Contest is due to take place. See September RadCom page 14 for further details.

Next the VHF/UHF Contest news:

The next RSGB VHF event is the 144MHz CW Cumulative which runs from 1930 to 2200GMT on Thursday the 1st of October.

During next Saturday the RSGB's 1296MHz Trophy will run between 1400 and 2200GMT.

The RSGB's 432MHz to 24GHz Trophy Contest will take place from 1400GMT on Saturday the 3rd to 1400GMT on Sunday the 4th.

The 2.3GHz Trophy Contest will run between 0800 to 1400GMT on Sunday the 4th. All of the Contest feature a SWL Section. See June RadCom for further details.

Special events

On Thursday the 1st of October REME will celebrate it's 50th Anniversary. To mark the occasion the Arborfield Amateur Radio Club plans to operate the club station from midnight GMT on the 30th of September to midnight GMT on Thursday the 1st of October using the callsign GX3IHH.

Activity on any HF band will centre on frequencies 10kHz above RSARS SSB Net frequencies, and 10kHz below RSARS CW Net frequencies plus/minus QRM. Further details can be obtained from G3ADJ by telephoning 0734 734882.

During Thursday the 1st of October the Houghton-le-Spring Amateur Radio Club will use the callsign GB6HF during their display of the History of Radio at the Kepier Hall, Houghton-le-Spring

Now for some news on repeaters:

Two repeaters have shut down due to the site being sold and redeveloped. The repeaters in question are GB3PE and GB3PB.

And now the solar factual data:

There was a major opening on the two metre band on the evening of the 16th. The panic on the money markets was as nothing, compared to the bedlam which took place when SU1MOZ/P appeared with a 5/9 signal. He apologised for not working the weaker stations, as most of northern Europe were calling him and he had severe interference from stations off the back of his beam. The Tropo opening extended from Spain right across Europe to Poland and up to Norway. Solar activity, as expected, declined and only two small M-type flares were reported. However geomagnetic activity reached storm levels on the 17th but was declining as this bulletin was being prepared on the 21st. For the period 13th to 20th September, spot counts meaned around 98 but varied considerably day to day. Solar flux levels declined over the period and averaged 119 units. The geomagnetic activity started very quiet but, by the 16th, was up to very unsettled levels, with a full storm developing on the 17th reaching an Ap index of 68 units. It was possible that an aurora took place. The period averaged an AP index of 19.5 units. Apart from the flares and magnetic storm the state has been 'nothing to report'. Not surprising the radio quality indices declined to very poor by the 17th due to the magnetic storm, but had recovered to become very good by the 20th, with the Canberra and Tokyo circuits being up to excellent. The aa indices as supplied by the British Geological urvey for the period 8th to 14th September gave a daily average of 45.3 nanoTeslas for the period, but on the 9th was up to 111.8 nanoTeslas with the afternoon auroral peak up to 310 nanoTeslas, equivalent to K7 plus. Bartells rotation 2174 begins on September 27th.

Now the ionospheric data for England and Wales:

Due to a major breakdown at Appleton we have filled in with ionospheric data from Poitiers in France which is on the Greenwich Meridian at 46 degrees north. So the F2 daytime critical frequencies at Slough, as reported by Appleton for the 11th to 15th, were 7.4MHz and the darkness hour lows 3.0MHz. From Poitiers for the 16th to 20th the highs were 8.8MHz and the lows 3.8MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 6.8MHz, and the

darkness hour lows 3.1MHz. Solar cycle 22 is still giving us some surprises. In spite of the recent steep decline, the last solar rotation 1859 gave us 22 M and 3 X type flares, making it the most active rotation since last February, and the 6th of September with 10 M and 2 X flares was the most active day since 7th March 1991.

And lastly the solar forecast:

This week, the more active side of the sun will be coming into view. Solar flux levels are expected to be about the 100s. Geomagnetic activity will possibly reach unsettled levels towards the end of the week. MUFs during daylight are expected to reach 24MHz, and darkness hour lows 21MHz. East west paths should be best on 14MHz around midnight.

And that's the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S L and G7 N Sa series, and Novice calls in the 2 0 A D and 2 1 B C series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

`There is plenty of good packet software available for Amiga's. The AmigaNOS
software for the Amiga is much easier to use, being multiple windowing, and
multitasking, than the PC versions. AmigaNOS is a robust version of the TCP/IP
based KA9Q internet software, and includes support for SLIP
connections,newsmailer, and many, many other features. Also there are some good PD
term programs, if your not up for tackling TCP/IP packet quite yet.'

Thanks for the info. As of yet I don't have my License, but I was really
curious as to wether I could or not, thats a huge relief. Is there anyone
willing to teach me stuff through email about Amateur Radio??

Cheers,
Grant (No callsign of yet!) (I'm a callsign virgin!) :-)

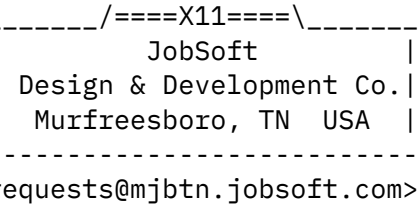
Summary: How well does KA9Q, KISS MODE, 9600 BAUD, and these units work?
Keywords: 9600 PACKET TCPIP GRACE AEA DSP-12 DSP-2232 KISS G3RUH
Lines: 39

Hi,

I am thinking about buying one of the two units mentioned in the subject line. I understand that they both handle KISS mode. What I don't know (and I hope some real users of these units can elaborate), is if I have either of these units, and I have them set in KISS mode (say using 9600 baud between the computer and the dsp box) and I am running KA9Q NOS under dos and/or unix (os not really important here), can I operate the G3RUH 9600 capability under TCP/IP to link to other 9600 tcp/ip nodes running, say, Gracilis PacketTwin's?

That is, KA9Q software as comes from WG7J, KA9Q, PA0GRI, ie, without special mods for 9600 tcp/ip and/or special mods for the hardware. I assume that since these units can run KISS, that the KISS drivers in KA9Q will work with them. I guess you would set the 9600 baud modem mode then start KISS. I know WG7J is working on JNOS which interfaces with high speed modems, but I think that this is a NON-KISS interface (like interfacing with an ethernet card on the bus).



Summarizing, with existing KA9Q software and either of these units running 9600 G3RUH in KISS mode, can I do 9600 TCP/IP? If so, would actual doers of this please describe setup/configration steps for the one you have. Is one better at this than the other???? Since it seems that Bob McGwier may not be working on the DSP-2232 anymore, should one steer towards the LL Grace DSP-12?

Thanks for any and all comments and advise! I really appreciate it!

73's,

Mark

>Bob

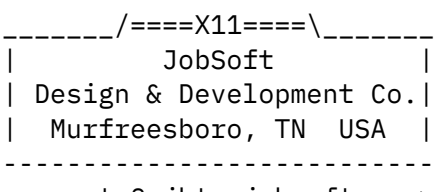
I admire Bob for the time and committment he has made in producing the
software for the 2232. I am sure that it is the best around. But (and I
have experienced similar "parting of the waters" myself) if (as Bob
describes above) he is no longer having anything to do with AEA, the
implications that he makes about "concerns" are really bothersome to me!

As I said, it is no doubt the best available now, but all the additional
things that we have been asking if the 2232 would be able to handle down
the road are now (IMHO) uncertain. I know that Bob is not the only one
that can program, but having been the sole (I assume) DSP programmer for
the 2232, I would suspect that AEA is going to face a real lag time in
coming up to speed with another programmer that *knows* the code that BOB
WROTE and has equal expertise in this field.

What I am driving at is that I *WAS* going to buy a 2232 (mainly because
I have great faith in Bob's ability). But if he is no longer involved
and does not appear to be doing anything further with it, I am *VERY*
hesitant to invest THAT KIND OF MONEY to what is now an uncertain future.

What if a bug shows up? What if whomever follows Bob on this project decides to "improve" on things? In other words, I would no doubt buy the 2232 if the author of the code was continuing to improve it. But I have seen too many cases where a company develops something, then the person(s) that develop that something for said company somehow get "stirred up" and in the company's reorganization effort for said development, chaos results. This would certainly scare me!

Now, the question is (and Bob your input is welcome - though not solicited :-)), does one buy the 2232 or should I now (forbid) go with the L.L.Grace DSP-12 ? It is cheaper (and maybe inferior), but at this point, I feel probably has a more certain future (or maybe I should say consistent).



I don't know. I am asking for your thoughts. I don't have the money for either units to "blow", so my invstment must be the wisest one! Any input would be greatly appreciated!

Bob, sorry things turned sour. Thanks for what you did manage to get done! I am sorry to see you off the project.

73's,

Mark

I picked up an AEA PKT-1 today at a swapfest, complete with docs (and I mean everything--all the manuals, technical manual, and I-don't-know-what-all ...)

Anyway ... Does anyone know anything about this TNC? Is it upgradable to work with higher speeds and these nifty new modes that I know nothing about? How can I get ahold of whoever ad the upgrade if it is available? Is it worth it? Any other info is of course greatfully appreciated: Advice, warning, or anything. I'm new with this packet stuff. :-)

It seems like several of the internet hams are now forwarding
Usenet/Internet/UUCP mail and news to packet.

Assuming you all trust each other, you could pool your resources
and start sharing the load of hand filtering traffic. For example,
once someone filters a news article, send it to other gateway sites
as pre-approved so it doesn't have to be re-filtered.

Hello,

I'm searching for the latest version of the Commodore 64 packet
radio program DIGIPROM MBXA 64.

I also want some info about Packet Radio from real HAM RADIO amateurs.
Because I'm not good how to explain it to other people.

I was asked by a dutch computer magazine to write an article about
Packet Radio. They want that I'll stimulate the dutch datacom
freaks. Well I'm already doing packet radio on 11m and it is great !

Greetings,

Several hams in the Culpeper Virginia area are in the process of setting up a
LAN to support our packet activities. I am providing a BBS service using MSYS
and have reached a point where I need to get the mail forwarding mechanism
set up properly. I would like to correspond with someone familiar with MSYS to
get some guidance on this topic. If you can help, please contact me directly
via Internet mail at segrest@bobseg.enet.dec.com.

If you can justify connecting thru the backdoor, you should be able to
justify a real connection. And as for limited access, there are a lot of
companies that run firewall systems to limit access to their local networks.
Doesn't this sound familiar??

Let's drop all this silly hide-and-seek garbage and take our place on
the INTERNET where we belong.

Can anyone recommend a good reference work (either a journal article
or a book or any other source where I can find out something about
digital satellite packet radio protocols, especially pertaining to
UOSAT.

I have to design a satellite packet radio archiver this autumn so
I'll need all the reference work I can get.

Thanks! All contributions (no matter how small) gratefully received.

Another good place to find HP95LX software is eddie.mit.edu, in the
/distrib/hp95lx (I think) directory. This site is mirrored at col.hp.com, as
well.

Well, sounds like a great idea.

I have found timeliness of `regular' (ie, non amsat/arl/kep stuff) not very important so your suggestion is quite workable otherwise as it could even take a week delay for someone to moderate and not cause any undue grief.

I would suggest that it be better, under the guidelines of USENET, that a new moderated group: rec.radio.amateur.to-packet for example, be created that allows even wana-bee gateway operators a chance to perform these gateway duties through the magic of moderation. The moderators duties would be to ensure that interesting articles posted to the various rec.radio.amateur.* groups be acceptable for packet operation, and perhaps even be formatted (SB.*/EX) and possibly edited (remove any .sigs with company information) and be ready for sending to packet. Messages taken off packet could also be placed in the group as a means of `wormholing' packet bulletins as well as well as to provide entertainment to the USENET community ...

Hi Folks,

I recently became qrv in at a new location and found out that the local TCP/IP system only runs POP3. AmigaNOS only contains POP2 server/client programs. Does anyone know if POP3 will be incorporated into future releases of AmigaNOS (I have Amiganos 2.9f).

Also, has anyone ever used the nntp stuff over Packet TCPIP? If so, how
did it work?

Thanks for your input..

I recently found out that the WECA group near New York City operates a
internet to packet radio gateay that one can possibly telnet to.
Could someone please email me information about how to use this gateway/
where to telnet to to use the gateway?

Thanks..

I am new to the area of packet radio and I have been reading
various radio mags such as Popular Communications.
I notice there are ads for software which run on a PC for
listening only, needing only a shortwave receiver.
I would like to do this first for a while before being involved
in sending (and therefore needing a license).
My questions are: is there Shareware available for PC to
                    =translate= signals coming off a shortwave
                    receiver, packet, etc.?

                  best recommended software?
                  what minimum type receiver needed?
                  how large memory needed for PC?
                  I only have a 256K Tandy at this point.
thanks.

In the documentation for TheNet X1G, there is mention of another version
that is available that includes the old HIGH/LOW commands that allow the
sysop to turn on the Connect LED or the Sta LED, for remote control of
devices at the site. The author mentions that he felt that not too many

people used this function anymore so they were deleted, but a version with the commands still active was available.

Does anyone know where I could get the version with the HIGH/LOW commands still active? I need something like this before I can replace the ver. 2.08 Plus that I am running now. (It also has an ON/OFF command). I use this feature to reset a PC at the site, and also to turn on & off an amp for one of the rigs.

By the way... I am REALLY impressed with this version of TheNet code. I wondered if anyone would ever incorporate the old "bank switching" technology from the days of CP/M, and was very happy to see it being done with the TNC-2. A lot of thought and hard work went into this code and it really shows.

Does anyone know an e-mail address for the author other than packet? Any help would be very much appreciated. Thanks.

Hello,

In packet radio networks, it would seem reasonable to expect short bursty and some random errors to occur during transmission.
I understand that the Reed Solomon scheme is good for correcting long bursty errors, but not efficient for correcting random errors, but still is apparently the error correcting scheme to use these days?

I am wondering which scheme I could use to be able to handle BOTH short bursty and random errors (to be used as an FEC scheme) for packet radios. I prefer replies to me directly as opposed to posting here on this newsgroup.

Thanks,

>Dennis.

A local ham here tried this and reckons an 8 MHz 8086 does not have
the grunt to do it. Sounds plausible, my experience is that to run
PA0GRI V1.7 properly on my XT (with a KISS TNC) I must put it in 10
MHz 'Turbo' mode. I think you'll be pushing it on an XT.

Cheers, Wilbert ZL2BSJ.

We are using aa4re running over g8bpq...
the aa4re connects node-to-node to GRAPES-NOS
software running in a switch to connect to another
non-aa4re bbs for forwarding...

Things go fine for a few msgs (random number)
until the GRAPES-NOS sends a ctl-z to the aa4re and
The aa4re appears to never see it...the aa4re times out...
The aa4re appears to miss the ctl-z...

Has anybody experienced this?
Does anybody have any suggestions?

Many thanks!

I? Misspell? Alas, Phil, you have wounded me! I was talking about my boat,
the one with four sails (yawl with double jib forward? or what do you call
that ketch rig with a top boom and a 4-sided mains'l, plus a tops'l?) and,
with somewhat creative grammer, referring to the pain and grief suffered
by ten thousand people who (like me) wish they owned a boat like that! :-)

Point taken, however, about the seemingly rampant misspelling surrounding
'amature' radio. :-/

My bbs code runs under UNIX, well SunOS. It uses sockets to communicate
between the tnc daemons and the bbs processes. It could probably be ported
to 386 based unix's. If you are willing to help in this activity I'd
be open to sharing the code.

Dear friends,
The first of all I would like to say hello to all members of this list
(I am a new one). I am working as a Packet station only from half a year
so we can say it is very begining. But I have a lot of fun after all!

At this moment I am working with small TNC manufactured by DK9SJ from Germany.
It is good but very simple only with basic possibilities. This is the rison I
will try to sell it in near future and to buy next one (better I believe). So
the question is if there is someone who would like to sell any equipment (new
or second hand) or knows where I could buy it the best. Every advise is welcome

I use two computers when I packet. These are IBM386 (usualy with SP6 software)

and Amiga 2000 (with AHP software). I know these programs are not the only and probably not the best. Therefor I am looking for new programs for my computers. After reading of this list I see that the most popular program for Amiga is AMIGANOS but I think none of my friends has this program. I wonder where can I get copy of it? There are so many programs for MS-Dos that I think I will need someone's advise which one is the best.

I am looking forward for any mail to me. I hope this list will bring me a lot of new friends, best numbers,

Greg, SP1WSN

It probably was packet radio. A typical packet radio address is
mine: K8EF@W8CQK.OH.USA.NA
K8EF is my call sign, W8CQK is the callsign of the RBBS (Radio
Bulletin Board System) at which I am registered to receive my
packet radio mail, OH is for Ohio where W8CQK is, USA is for
United States of America where Ohio is, NA is for North America,
where USA is. So you need to know which RBBS he is registered
with, and find a packet ham or landline to packet radio inter-
change. There used to be WP (White Pages) on some RBBS's
from which one could get the home RBBS for a known callsign.
73 (Best Regards) and GL (Good Luck)

gerry@bluemoon.rn whose home bbs has trouble getting the
mail out sometimes, so it may go here instead.

>>I though Brian summed things up very well..... Do what you want to do
>>with the gateway. but keep in mind the RF side of the gateway is
>>where the FCC would be visiting.

>How "anthropomorphic" of you. Thanks very much. Now I understand.
>

>Now why would the FCC be visiting? And what would they be visiting?
>(You "though" wrong. I'm not looking for trite answers... I'm asking for
>real experience, so don't bother responding if you have nothing more to add.)

Oh, lighten up.

I don't think the answer is all that trite. He means that the FCC regulations apply to the RF side of the link, so if the FCC determines that you've sent or done something against regulations, they may well pull your license. That would be your problem, and yours alone. The operator of the gateway isn't responsible for what you do.

The gateway operator is responsible for his/her actions, though (hey! I "though" right!), and isn't going to do anything that will cost his/her license, and any policy on that gateway will reflect that (or the operator's willingness to take risks).

It boils down to this: you take your risks, you accept your consequences, and you are on your own.

Brad
  The gateways that I'm familiar with are of two classes:

  Only registered internet-side users can send to packet. Packeteers
  cannot
  get real time from the gateway. They can only send TO the
  gateway via normal packet mail or smtp. If the packeteer gets
  something FROM the gateway it's because the gateway has the ham
  as a registered user and the mail is from a ham on internet
  who is registered with the sysop, or the sysop has specifically
  authorised the message to get through.

  The other class of gateway is where the ham can telnet or ftp
  to systems across the gateway transparently. It is quite possible
  in this situation for the ham to request information, or get sent
  information, that will pass over the radio that violates FCC rules
  (part 97). If this happens chances are that the FCC won't notice.
  If this goes on for a while and especially if it is public
  knowledge that this is going on what happens is that the amateur
  radio community is cheapened by it. Eventually the US gov will
  decide that they don't need hams, like they don't need CBers.

  I'm of the opinion that we should strictly follow and respect
  the FCC rules and change them or request changes when we don't
  believe that they are fair or sensible.

...
  SInce I am typing this on the fly I didn't want to type it into
  the newsgroup directly. You can repost this if you want.

Good morning. It's Sunday the 20th of September and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

First the headlines:-

The RSGB HF Convention is next weekend; the GAM1 beacon tests were a success;
and we have the winners of the RSGB 70MHz Cumulative Contest.

The highlight of the HF DXer's year takes place next weekend: The RSGB

International HF and IOTA Convention is on Saturday the 26th and Sunday the 27th of September at the ICL Beaumont Conference Centre, Old Windsor, Berkshire. This is a new venue.

Over 100 DX amateurs from more than 20 countries, including the CIS, are planning to visit the UK to attend the Convention which starts on the Saturday at 0915 with talks and lectures on the RSGB's popular Islands On the Air (IOTA) Award programme. A DX Dinner will be held on the Saturday night.

On Sunday, a full lecture programme includes well-known personalities Peter Hart, Mike Grierson, Peter Chadwick and Ross Clare, covering HF technical issues such as transceiver performance and construction, SWR and linear amplifiers. EMC will be discussed by Robin Page-Jones, the HF Contest Forum will tell you how to win HF NFD, HF trophies will be presented, and the latest contest logging software will be on show. The UK DX Packet Cluster Group will be demonstrating how to use this DX Information system and David Rowley from Strumech will talk about selecting and using your tower safely.

There will be the opportunity to try on air the latest HF equipment and the current versions of DX software. The lecture stream includes talks on expeditions to the Pacific, the Indian Ocean and Clipperton. There will also be an RSGB Bookstall, and tea and coffee is free. Overnight accommodation is available. For full details, see the September edition of Radio Communication, page 15, or contact Bob Whelan, G3PJT, on 0223 263137.

Next the results of the RSGB 70MHz Cumulative contests held on five days during January, February and March 1992. The Open Section was won by G4ZTR/P with 2881 points and the runner-up was EI2CA/P with 2709 points. In the Single Operator Fixed section G4ASR won with 2712 points, with G4SEU coming second with 2566 points. Congratulation to all concerned. The full results will be published in Radio Communication just as soon as space permits.

The tests of the RSGB's high power propagation data beacon, GAM1, proved to be successful. Thanks to all of those who sent in reports from all over the country. The Morse speed raised many comments as it was 18 words per minute, which is faster than will be used when the station is put in service, but this was done to test the keying system.

News now of a vacancy on the RSGB's Training and Education Committee. This position is for an RSGB member involved in, or interested in, the training and educational aspects of amateur radio. The committee meets five or six times a year, mainly in Cardiff. Interested parties should contact the Chairman John Case, GW4HWR, whose address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Bahamas, the special call C6A500 {Newsreaders, this is five hundred} will be aired by the Bahamas Amateur Radio Society throughout the month of October to celebrate the discovery of the New World by Christopher Columbus. All members of the BARS may append /500 to their callsign during October. From Ecuador, HC3AP will be active on 80 metres daily until the end of September. Operating times are from 0000 to 0500 GMT around the frequency 3780 to 3800kHz. During next weekend check 7030 to 7050kHz on CW and 7085kHz on RTTY. From Mariana Islands, JR6IQI and JK6UER

will sign as KH0/ own call from today until Tuesday the 22nd, on the 160 to 6 metre bands, using CW and SSB. From Moldavia, the special callsign RO0Q will be active during international RTTY contests.

Rally news now, and we know of two events for today Sunday the 20th.

The Centre of England Autumn Radio Computer and Electronics Rally is being held at the National Motorcycle Museum, Bickenhill, near the National Exhibition Centre, off junction 6 of the M42. Doors open at 10.30am, or 10.00am for disabled visitors. The event features over 60 tables. Refreshments will be available and there is a large parking area. Talk-in will be on channel S22.

The East of England Radio Rally is being held at the ICI Building, East of England Showground, Peterborough. Doors open at 10.30am, or 10.00am for disabled visitors. There are trade stands, a bring and buy stall and a radio-and-electronic car boot sale. Refreshments are available.

There are two events for next Sunday the 27th of September.

The Harlow Amateur Radio Rally is to be held at the Harlow Town Sports Centre, Hammarskjold Road, off Fifth Avenue, Harlow. There is easy access off the M11 Motorway at junction 7, the A414. The venue will be signposted from this location. Doors will open at 10.30am and the event features traders, large bring and buy and special interest groups. There is on-site parking with full facilities for disabled visitors and refreshments will be available. Talk-in by G6UT is on channels S22 and SU22 . Further details can be obtained by telephoning 0279 432306 during the day and 0279 722569 during evenings and weekends.

The North Wakefield Amateur Radio Club Radio Rally will be held at the Outwood Grange School, Outwood, Wakefield. the school is located one mile from the M1 and M62. Doors will open at 11.00am and the event features trade stands, a bring and buy stall and repeater group and Novice stands. Refreshments will be available and talk-in will be on channel S22. Further details can be obtained from G4RCG by telephoning 0924 362144.

Contest news next:

Next Wednesday the 23rd, the third of the RSGB QRS Cumulative contests takes place from 1900 to 2000 GMT. These events feature slow Morse and further details can be found in July's RadCom. During next weekend, Saturday the 26th and Sunday the 27th, two overseas contests are scheduled to run, the SAC SSB and the CQ WW RTTY The next RSGB VHF event is the 144MHz CW Cumulative which runs from 1930 to 2200 GMT on Thursday the 1st of October. See June RadCom for further details.

Repeater news now:

The Leicester Repeater group have lost the use of their three repeaters, GB3CF, GB3LE and GB3GV and the beacon GB3LEX, due to vandalism at the site. They will be off-air until further notice and there will be no GB2RS broadcasts from the site until GB3CF returns to service.

And now the solar factual data:

The period 7th to 13th September has seen considerable flare activity, together with a major magnetic storm and aurora. A major outbreak of flare activity, which started on the 5th of September, has continued throughout the period with 13 M type flares, some being up to M7.1/2B. Sun spot counts have remained surprisingly low and meaned at only 82. The solar flux levels were reasonably steady all the period and averaged 122 units. The geomagnetic Ap activity steadily increased from the 6th with unsettled levels of 17 units, up to major storm levels of 90 units, about K8, by the 10th. There were numerous ionospheric disturbances and geomagnetic sudden storm commencements, some very marked with sudden impulses up to 52 nanoTeslas at Boulder. The storm finally ended at 1500 hours on the 11th. Levels declined to very quiet on the 12th and 13th was down to only 3 units. There was a small aurora on the 9th, with a much bigger one on the 10th. The state has been very disturbed every day, up to the 12th when it dropped to nil. The radio quality indices dropped to very poor over the period, with the Fort Collins and Tokyo circuits being down to extremely low levels. However, by the 12th, levels were returning to normal. The aa indices as supplied by the British Geological Survey for the period 1st to 7th September were unsettled with the daily averages for the week being 39.3 nanoTeslas. However, the 3rd was very disturbed with periods up to 116 nanoTeslas.

Now the ionospheric data for England and Wales:

This week we are short of some data. However the F2 daytime critical frequencies at Slough, as reported by Appleton, for the period 7th to 10th September averaged 7.0MHz. Levels dropped to only 5.7MHz on the 10th. The darkness hour lows averaged 2.0MHz.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 6.7MHz and the darkness hour lows 1.9MHz.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way. Solar flux levels are expected to be around the 90s. Geomagnetic levels are expected to decline and be about just unsettled. Ionospheric MUFs on north/south paths during daylight are expected to reach 24MHz, and darkness hours lows 14MHz for east/west circuits.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S K and G7 N R series, and Novice calls in the 2 0 A D and 2 1 B C series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society

of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Seems that many people don't like this program. In case people didn't know, WA8BXN put message screening in MSYS over a year ago. I installed the M_FILTER program on my FBB BBS, but not for censoring your everyday message. Being in Detroit, Michigan, we have our share of nut cases. People have actually got on packet and sent messages such as "*uck *ou", I'm gonna kill you, etc... Amazing that people will get on packet and threaten to kill someone or sue someone adn others will plainly start swearing obscenities.

I removed most fo the words since I don't want to stop or censor messages, but I will not allow a threat message on my system. I could care less about most of the words though in the list.

I also hate it when people get on the BBS from other BBS's (other sysop's or remote sysop's) and start sending nasty messages to my users that they are sending something illegal. I tell them to contact me or contact the person directly off of ham radio. If you are looking for something illegal you will eventually find something whether it's illegal or not. If it is illegal then you will know, so the best thing to do is just let stuff pass and concentrate on building better networks.

Apparently not true; the protocol is online. Two kind readers provided
me with a 65Kbyte AX.25 protocol file which begins:

>   AX.25 Amateur Packet-Radio Link-Layer Protocol
>   Version 2.0 October 1984
>
>
> 2. AX.25 Link-Layer Protocol Specification
>
> 2.1 Scope and Field of Operation

In attempting to QSO with the SAREX packet robot yesterday, I logged a
UA in response to my SABM (i.e. SAREX ack'ed my connection request).
However, it was late in the pass and I received no further frames
from the robot.

Does SAREX log the QSO just upon receipt of the SABM, or does one
have to send something else?

Dana

 I do not accept that our responsabilities as amateur radio operators
 includes that we can 'take risks' and push the law to the limits
 at which we might get caught. The most likely conclusion of this
 kind of action is that we will lose legal access to the spectrum all
 together. If you are happy with the idea of operating outside the law,
 why do it on amateur spectrum at all? How likely is it that you'd be
 caught running links on non-amateur UHF bands? Please don't muck up
 the amateur spectrum with your illegal activities. I have much too
 much
 fun doing things legally to have you all screw it up.

Here's an interesting problem that I've been pursuing in my spare time.
I've got a computer program that accepts audio input from a short wave
receiver
tuned to Morse code broadcasts and converts it into a binary stream. The
data is collected at 60 samples a second where a "1" indicates a signal
amplitude above a certain threshold and "0" indicates an amplitude below
the same threshold.

When displayed graphically, the series of ones and zeros looks pretty much
like hand-written Morse code. Here's the interesting problem. Does anyone
know of an algorithm that can be used to convert the Morse code bit stream
into ASCII text? Given that individuals transmit with slightly different
speeds and styles, is there an effective algorithm for consistently
converting this data from its analog representation to ASCII?

Please respond through e-mail and I'll post a summary to the net.

Tadd,

Much of what has been done on Packet Radio was done in absentia of specific rules
for dos and don'ts. For example when I and few others formed NEPRA, we weren't
sure
whether a 'digipeater' qualified as a repeater under the rules, so we chose
145.01,
a simplex frequency in the repeater subband. We followed the rules the best we
knew
how, but didn't wait for a bunch of rules. The same thing happened when I showed
W0RLI
a CP/M motherboard which could be purchased cheaply from from Xerox Surplus, all
of
a sudden we had a bunch of unattended, automatic systems on the air. Eventually
rules caught up with the technology, but back then we were pushing the envelope
of the current regulations. The key, I believe is to keep within the spirit of
the rules and of Amateur Radio. Use reasonable measures to insure compliance and
if
you mess up, beg forgiveness and fix the specific problem.

Hello

I am trying to find out information about the Paccom (I think)
Tiny 2 TNC. Are they still available? Does anyone know the phone number?
Are there other manufactures of a pocket packet TNC? I am trying to put
together a portable packet station.
Thanks 73

HOGWASH!

Part of our responsibilities as amateur radio operators is to push
technology to it's limits. In doing so it is oten necessary to push
the "law to the limits".

> kind of action is that we will lose legal access to the spectrum all
> together. If you are happy with the idea of operating outside the law,
> why do it on amateur spectrum at all? How likely is it that you'd be

And if all the worry-warts in the world had their way, no one would do
anything that had the slightest risk.

> caught running links on non-amateur UHF bands? Please don't muck up

> the amateur spectrum with your illegal activities. I have much too
> much
> fun doing things legally to have you all screw it up.

Internet-packet gateways, newsgroup and mail feeds to and from packet,
FTP/TELNET to and from packet. I'm having to much fun with these to
subscribe to your rather restrictive view.

Hallo from Germany!

I am very well interested in Packet Radio, and tried some few
steps with an old C64 using this ax25 protocol.

Can anybody explain, what TCP/IP is and how it works. At the moment I
don't have a clue of it....

Any comments welcome...(please as pm because no regular access to this board, thanks a lot)

Greetings all...

Just wondering about the speed of Packet mail. How long would it normally
take for a message to (for example) travel from one side of the US to the
other? I'm quite new to packet BTW...

Yup there is packet dx. If you live in the western states, you
can hook up on vhf to your nearest friendly 5000-10000 ft mountain, and
then to the next one 100 miles away, then another and another and another.

Back when I had the patience to do this I had some QSOs with people in
Montana, Colorado, Texas, etc... from here in Southern California. While
the signal was repeated many times (and took up air time in several
communities - some people frown on this sort of thing) it was all VHF/UHF.

One problem with "packet dxing" is that it often doesnt work when there
is activity. This is basically the result of the hidden terminal problem.
Some areas have high-speed trunks set up on several frequencies so that
long distance communications are possible somewhat regularly.

The links from California east into AZ and to El Paso I have had regular
good luck with.

In HF dxing you are mainly at the mercy of the bands. With packet it depends
more on what your comrades have assembled to relay the signals, and on
having current "maps" of the network. Back east because of the lack of
mountains it can be difficult to go long distances.

In some areas, packet is attached to the internet (usually at a university
with an amateur club...) in a controlled fashion (for license preservation).
The internet is used as a free intercontinental modem to ship packets
between networks around the world. Therefore, you could talk to a VK ham
if such a gateway has been placed on the air in your area. While its neat,
and encourages people to try packet, it is the landline that is doing all
the work (so is it really ham RADIO? probably not). However in the future
maybe hams will develop satellites that could do this.

Tadd,

I'm not advocating breaking regulations. Far from it. But there have been many situations where the regulations in some areas have be ambiguous when applied to certain technologies. It is in these cases that we push the law to its limits, as mentioned before. It's not a deliberate breaking of the regulations...it's making our best guess as to how the regulations apply to what we are doing in absence of the FCC's direct clarification of the rules. Sometimes the FCC agrees with us, sometimes it doesn't. Whatever way, we are responsible for what we did.

This is not advocating breaking the rules, simply stating that if you interpret something that's unclear (or deliberately break the rules, for those few dingdongs who insist on doing so), it's YOUR problem, not the net manager's, not your mother's, not the Democrats'. Yours.

I think the FCC is clear on this, it IS your problem. They made a
ruleing some time ago of a posting on ax25 of 900-xxx-xxxx phone number
listing. not only was the sender fined ~$3k for business use, but EACH
of the NODES that forwarded the mail was also fined too. (about 5 or 6
nodes if I rember).

At clarkson we have an innernet gateway (the rf side isn't up yet so
its currently borring, but it will be very exciting soon!!) but one
must be carefull what is passed, regardless of who requests it, it's
YOUR call that is transmited as the porno gifs are sent to him.

Does packet fax exist yet? That is, can you hook up a fax machine
to a radio, send it electronically, and it be received on the other
end? (or is this an FAQ?) Or, perhaps, a macintosh/fax combination.
I would imagine it could take awhile to send a fax page this way, what
with all the error-correction signals that might have to be repeated.

Also, a friend of mine would like to set up either a packet fax network
as described above, or a packet e-mail connection, between the US (Kentucky
specifically), and El Salvador, as he has business there. Where would
we start?

Please respond by E-mail, if possible, as I *might* forget to check this
group for a response. Thanks.

NNTP-Posting-Host: ucsd.edu

The following is a summary of the responses I received to my queries about packet software for the Macintosh which may be of interest to other readers of this group/list. Any additions or corrections readers can provide would be welcome.

++

Packet without a TNC

SoftKiss is an init/cdev/driver that allows a Mac to do packet using only a "poor man's packet" modem. It is available by ftp from akutaktak.andrew.cmu.edu (128.2.35.1) in directory /aw0g, as well as from the compuserve hamnet forum (library 9). Requires NET/Mac. Latest version is 1.2.2. Free.

Terminal

Virtuoso is a packet terminal program for the Mac which features adjustable split windows with all the usual Mac features (scrolling, cut and paste, print, etc). Also scripting and selectable fonts. Available by ftp from ucsd.edu (dir /hamradio/packet/misc) as well as from AOL, Genie, and Compuserve. Latest version is 1.4. Shareware fee is $20.

The three main producers of TNC's sell Mac versions of their packet terminal software. These are MacRatt (AEA, $69), MultiComMac (MFJ, $50), and Hostmaster II (Kantronics, $65).

TCP/IP

NET/Mac implements TCP/IP (as well as AX25) with SoftKiss or with a TNC that has been put into KISS mode. Can handle multiple sessions,

each with its own window. Windows are not scrollable or savable, but
individual sessions can be recorded to a file. Available by ftp from
sumex-aim.stanford.edu (dir /info-mac/comm/radio-). Latest version
is 2.3.6. Should be used with the SMTP mailer IM/Mac 1.0b25b and the
configuration and accessories collection called "radio-config"
available from the same place. All free.

(Note: NET/Mac is available from many sources in various versions,
sometimes bundled with another mailer called BM)

PBBS

NET/Mac provides for file sharing via ftp, but there appears to be
currently no real packet BBS software for the Mac. The author of Virtuoso
is working on such a program, however.

With the obligatory caveat that everything depends on what nodes are
up/down at the time:

I've seen overnight delivery frequently between Atlanta, GA and

Hammond, LA. (~half cross US). Average would be a couple
of days. A few hours to get to an HF site. I guess the HF site
sends stuff once a day and then a few more hours to get to
the addressed BBS. The average gets skewed by really long delivery
times when a site is down or it's mailer is hung and the mail
sits there for several days.

I consider the delivery time pretty good for doing email stuff. I'd
guess that the reliability I experienced was about 50% (msg sent/msg
rec). My correspondant finally got on internet so we never tracked
down the problem, but I suspect most of it was between him and his
BBS.

Good luck.

     I just moved to Seattle, WA, and I have a little problem :) There
are three towers outside my window (~3 miles line of sight); 2 radio and 1
TV I think. I'm running on a Yeasu FT-415 HT @ 2 watts. On the duck, things
work pretty well, but whenever I use an external antenna (a mobile quarter
wave or a "copper cactus" j-pole on the roof), everthing coming in is
filled w/ white noise. I can't really run packet on duck, but on the
j-pole, I'm hitting a BBS w/ 2 watts at S7. He is sending back w/ 50
watts, and the static just butchers his signal. I'm hoping that a tight
144-148 filter will do the trick for me. If anyone has any other
suggestions, or knows where I can get a good filter, please leave me mail.
Before coming to Seattle, I was running packet without difficulty. Thanks!

 [some of Harold's response deleted...]

When I was first getting into packet, I posted a message here asked for packet
penpals. I was sending mail back and forth to a person in Washington state. I
wrote him with the time I sent the message out to see how long it would take. The
reply from him said it took just a little over 2 hours until his BBS got it. Two
to three hours is pretty good from Ohio to Washington. This seems almost too
good, but he did mention an HF gateway between a local site and one in Illinois,
so this might have been why i

t was so short. Plus, there may have been some error in converting time zones
because I didn't include the GMT time.

Does anyone know of a 9600 baud baycom type modem?
I just got my station up and already I want more speed. I was thinking of
getting TAPR's modem and hacking a serial port on to it, will that do the
trick? I really don't want to pay large amounts of money for it, but I
am willing to do a bit of soldering and programming to make things work.

Thanks and 73

It doesn't take a rocket scientist to figure out that the ham whose call is
the packet gateway would have to be a moderator screening for dirty words and
business rule violations. But there are moderated newsgroups, so, if one
were to limit the gated newsgroups to a small number, someone could do that.
E-mail: if one were to accept E-mail from only his immediate area (not

necessarly geographic), it might be a do-able load.

Would there be any interest in creating a newsgroup that would be fed
from the packet network? So Internet newnews readers could see the stuff
that floats around the ham packet net? One packet BBS could be the source,
and the packet to internet direction would be automatic. Anything from
internet would have to be moderated. This would be a moderated newsgroup,
then. (No, I don't have the resources myself.):).
Call it rec.radio.amateur.bbs or some such?

You really have to be kidding! Who would WANT to read the trash that is
posted on packet bbs anyhow? After being a sysop for 8 years, having done
my thing with hf/vhf etc.., I can truthfully say there have been less than
10 dozen really Intelligent posts that came thru my box. The intelligence
level of the short between the keyboard and seat has a definate impact on
message content :-)

Yes, we meanwhile have three 9600 MODEMs:

1) The USCC card
Its a slotcard for PC's (8bit). There are four Ports on it. It does not use
COM-Port addresses. Three of the four ports are connected to MODEMs on the
card, the fourth port has a MODEM-Disconnect standard plug like TNC.
1st MODEM is TCM 3105 which means 1200 baud fixed
2nd MODEM is AM7911 for 300baud/1200 operation
3rd MODEM is G3RUH compatible (design by DF9IC) and does 2400-38400 baud. The
standard speed is 9600 baud (one has to change capacitors for other speeds).

2) The standalone G3RUH/DF9IC MODEM:
Its simply a part of the USCC card, carrying the MODEM alone, provides
compatible plug for either RMNC-controller or TNC2. Besides that "standards",
it provides a new "standard" plug which is designed from the ADACOM group
especially for high speed applications.

3) The plug and play 9600 solution named SCC9k6:
Its a short slot card carrying

a) Bus decoder logic
b) G3RUH/DF9IC 9600 baud MODEM
c) a KS-900 tranceiver (crystal operated 2Watt/70cm)
d) a port for a 1200 Baud MODEM, f.i. the BayCOM SMD-mini

4) There is a concept (and only a concept) for a plug-on MODEM for
9600 Baud .
This maybe finished about Christmas perhaps...

Hope this is info enough, you may always contact me via mail.

Fritz
DF2RF@DB0AAB.DEU.EU (this is a BayCom 9600 node :-))

I looked through FAQ for this answer but was unsuccessful. Is there a standard
rfc for AX.25? Where can I get it?

Any good PD ax.25 programs for the Mac that are worth looking into?

Don't read this group very much so it would be appreciated if you email
responses. Thanks in advance.

Yeah, but they dropped the fines. Or did everybody forget about THAT part?
Getting a NAL is not the same as paying the fine. (Once you heart restarts.)
The people that responded (key word) to the FCC had thier fines dropped.
The alledged originator swore up and down that he DID NOT originate the
message that it must have been someone using HIS CALL, and was NOT fined.
The few that had to pay (and this was more for failing to properly answer
the NAL) were fined $300. The issue never really did get resolved properly,
but like so many other things, the media hype and attention died down and
things went back to business as usual.

I run an internet e-mail gateway (hand operated, nothing fancy) for the
occasional user that wants to have access to this media (and vice versa).
I trust my users are intellegent enough to not want me to show up at 3:00
AM in the morning with a NAL in one hand and a 12 gauge in the other. Most
of the work, checking, labor involved is seeing to it that things are sent
correctly, not what is sent.

Things happen, nobody's perfect and the FCC understands this. They just want
the Licensee to take reasonable measures to keep things in line. And for when
something wrong does happen, to take the effort to explain how it happened and
what steps will be taken to preclude it from happening again.

From around 2 days to infinity. Since HF forwarding exists,
I doubt if anyone knows how long it would take without it,
but it might be better than we think.

gerry@bluemoon.rn whose home bbs has trouble getting the
mail out sometimes, so it may go here instead.

I am constantly being asked `when will XXXXX be in the AEA DSP box?' or
`when are you guys going to do YYYYYY?', etc. I wrote all the DSP code for
AEA that is in the DSP2232 and DSP1232 as of two months ago. Please be
advised that I no longer have anything to do with AEA. My relationship
with them has ended. Should you be concerned that the author of this code
is not supporting it, and wonder who is (especially if you have not purchased
a unit yet) and would like to know who is responsible for the answers to the
questions above, please direct them to AEA and not to me. I do not even
own a DSP2232 or DSP1232 and cannot support you in any way so for technical
information on the units, please direct these inquiries to AEA also and
cease bothering me with mail I have been ignoring anyway.

Gee, Bob. That doesn't seem very friendly. I can recall just a few months ago that you were boasting all over these groups about having been solely responsible for the code and wanted to answer everybodies and anybodies questions about DSP's and their relationship to ham radio. Obviously, something has gone sour... Too bad, as situations like this are only going to slow the wider spread use of DSP devices, if too many people believe that they drive people to these extreme mental states... Good luck in your recovery.

Greetings

I'm wanting to get into Amateur Radio and Packet sometime in the near Future, I have an Amiga 500 with 1 meg memory, is there software available to run Packet on my Amiga?

Also any help in training for Amateur Radio through Email would be greatly appreciated, as I want to get into the scene, but I dont know where to start.

Thanks
Grant

Would anyone care to share some detail about this incident? It sounds as
if those people were delt with rather harshly unless it was a deliberate
act done after being warned. Did those receiving the fines try to
challenge it or did they look at the legal costs and decide it wasn't worth
the fight?

> ARRL".

Golly, do you think anyone will even notice? Messages traversing the
ham packet network often sit at a forwarding site for longer than that
in ordinary operation.

I mean, if people shut down forwarding for a MONTH, maybe we'd notice a
drop in traffic (mostly fewer 'radio for sale in New Jersey' notes),
but anything less than that isn't going to be noticed.

And by that time we'd have routed around the downed HF forwarders.

Not to say that HF forwarding isn't moving traffic - it does. But like
a dog walking on its hind legs, it doesn't do it very well. We really
need to come up with something better.

I've been on packet for quite a while now but am just about to start
playing with TCP/IP. Can anyone point me in the right direction to
get an IP address?

I know there are supposed to be regional coordinators but have no idea how
to find out who they are.

Any info would be appreciated. Please respond via email.

Thanks, Seth

"Not ideal" does not equal "useless". I've never used anything *except*
an HT for packet. I don't even have the necesssary connector to hook my
TNC to my mobile rig.

You've got a fine start. Just add a TNC and some communications
software for the Mac, connect everything together, and you'll be fine.

Sure, a little amplifier for the HT would be nice (I have a 3x4-inch
25-watt Vocom), but if you can get a small antenna outside and have
some nearby packet PBBSs or digipeaters, you can get by without the
amp. I leave mine off most of the time, which means I'm connecting to
a node 25 miles away with only 2 watts and a 1/4-wave whip at 15 feet.

As for software, any terminal emulation program (MacTerminal, Microphone,
Microsoft Works, etc.) will suffice. Or, if you get a TNC that has KISS
mode (highly recommended), you can use a more intelligent comm program,
such as the Macintosh version of KA9Q's TCP/IP-based NET program. It
handles NET/ROM and AX.25 connections as well as TCP/IP, so you can use
it for everything. It's on ftp.apple.com if you want to grab it.

Patty

p.s One thing you'll need to remember if you've added a built-in modem
to the PowerBook is to use the "Portable" control panel device to
switch to External Modem when you're using the TNC. Otherwise you'll
drive yourself crazy trying to figure out why the packet system isn't
working. (Heed the voice of experience. :-))

Or, if you aren't using the other (nominally printer/AppleTalk) serial
port for anything, you could just set up your comm program to use that
one instead, leaving the nominal phone port connected to the internal modem.

Does anybody know where to find Graphic Packet by DH1DAE?
I have checked all the Internet FTP-sites I know of but haven't
had any luck. If somebody has it could he/she upload it to some
anonymous FTP-site and inform the rest of us about it.

Thanks in advance.

Hi everyone,

I have been a Usenet news reader for 1 years now. During reading news from
other newsgroups, sometime I heard about packet radio but not in detail.
I have several questions about packet radio and what it can do. I hope
some one from this newsgroup can give me an answer or point me to the FAQ

file.

1) What is packet radio ?

2) Can someone use packet radio to read, or post Usenet news ?

3) What about email, telnet or rlogin ? Is it possible ?

4) What kind of equipment is need to get into packet radio ?
   IBM-PC ? DOS/UNIX ? MODEM ? RADIO ?

5) How much will it cost (minimun) ?

6) Where can I find a source for newsfeed ? Is there any money involve for
   newsfeed ?

I will finished my study at the university soon and then I will lost access
to Usenet. I am following alt.unix.bsd newsgroup and I don't want to loss
the access after finishing my study.

7) I may move to Toronto or Montreal or Hong Kong. Is it possible to use
   packet radio to access newsgroup at these cities ?

8) Please also point me to a FAQ as well.

Thanks!

No, the AX.25 protocol isn't available on line. You can buy a copy of
the spec from the ARRL for $8.

>   AUR1>N0MXS [via LOV*] <RR (P) R0>
     aur1 says to n0mxs, "are you there? I'm ready for frame 0"

>   N0MXS>AUR1 [via LOV*] <RR (F) R5>
     n0mxs replies, "I'm here, nothing for you, I'm ready for frame 5"
>   AUR1>N0MXS [via LOV*] <I (Text) R0 S5>:
     aur1 says "here is info (data) frame 5, and I'm still ready for 0"
>   AUR1>N0MXS [via LOV*] <RR R1>
     aur1 says "i'm now ready for frame 1 [ack frame 2-7,0]"
>   AUR1>N0MXS [via LOV*] <DISC (P)>
     aur1 says "knock down the connection and acknowledge that you did"
>   N0MXS>AUR1 [via LOV*] <UA (F)>
     nomxs says "ok, I did that in response to your request"
>   WA5VRL-1>ID <UI (Text)>:
     wa5vrl-1 broadcast some text
>   N0MXS>AUR1 [via LOV*] <REJ R1>
     n0mxs says "I'm missing frame 1 from the bunch you sent, so
     please resend it and all the ones after it."

(Note that all these are via a digipeater 'LOV' which is what the
monitoring station is hearing.)

Hope that helps. You really need a copy of the protocol if you want to
see the details of what's going on there.

I've just made several attempts to download grac9208.exe and grac9208.zip
off the Gracilis BBS but seem to get dumped off their system midway
through the transfer. Are these files available for FTP anywhere? They
are dated Aug 15 and seem to be the latest version for the PackeTwin package.

Thanks in advance.

I'm posting this answer since more than one person has posted similar
requests today.

>1) What is packet radio ?

Packet radio is a method of transmitting digital data via radio. It
sends information in "packets", or short bursts, and then waits for
an acknowledgement. This is known as an ARQ protocol. There is a
check sequence in each packet that allows the receiver to determine
if a transmission error has occurred. The system works somewhat like
an Xmodem file transfer in that it resends packets that aren't positively
acknowledged. In addition, each frame has an address header that identifies
the sender and the intended receipent. Unlike telephone transfers, packet
is used on shared broadcast channels so some means of identifying the
sender and receiver of each frame is required.

Packet radio, as it is usually practiced, is a half duplex system. The
common speed is 1200 baud. But because it is half duplex, and because
it is a stop and wait for acknowledgement protocol with considerable
overhead in each frame, it's thruput is considerably less than a common
1200 baud telephone connection. Real direct point to point connections
generally have an effective thruput of less than 300 bps. There are
faster systems available, 9600 baud and 56 kilobaud, but they aren't
in common use yet. These are all VHF/UHF systems with limited range.
At shortwave, the baud rate is restricted to 300 baud or slower, and
the thruput is very low, though the range can be worldwide.

Packets are often relayed through other user's stations to extend

range. Normally each relay step will halve effective thruput. Paths
with more than four relay steps are generally unusable.

>2) Can someone use packet radio to read, or post Usenet news ?

Yes and no. *Amateur* radio has content restrictions and third party
restrictions that limit it's usefulness for Usenet access. No commercial
content, and no profane or indecent language can be transmitted. In
practice this means that a gateway station must manually screen traffic
from the Usenet. Traffic sent *to* the Usenet is the responsibility
of the amateur sending the traffic and places less of a burden on the
gateway operator. Third party rules are also a problem. International
messages for or from a third person can't be passed between amateur
stations, except if the countries involved have international third
party agreements. There are only a limited number of countries that
have such agreements with the United States. This is only an issue
if the amateur stations involved are in separate countries.

>3) What about email, telnet or rlogin ? Is it possible ?

All of this is possible, with the same restrictions listed above for
general Usenet news access. No commercial use, no profanity, and
no international third party messages except where authorized. The
generally slow speed of packet makes interactive usage painful in
most cases. Use of 56 kilobaud systems, however, is nearly as good
as a wireline 19.2 kb connection. Even interactive editors are
easily used under these circumstances.

>4) What kind of equipment is need to get into packet radio ?
>   IBM-PC ? DOS/UNIX ? MODEM ? RADIO ?

In the simplest case, a terminal, or terminal emulator program, a
TNC (Terminal Node Controller), and a radio are all that is required
to become active on packet. Most users prefer more sophisticated
software with a PC of some sort. The KA9Q TCP/IP software for example
is available for DOS, Mac, and Unix systems.

>5) How much will it cost (minimun) ?

This is highly variable. A (free) junked terminal, a used TNC ($70),
and a surplus radio ($50) can get you on packet. Or, you can spend
much more for new PCs, TNCs, and radios. The average price for new
equipment, excluding the PC, is in the $500 to $700 range. In the
most advanced cases, some of us use Sun workstations and 56 kb RF
modems, you could spend several thousand dollars, most of that for
the workstation. A 56 kb RF modem costs $250 and a transverter to
shift it to a UHF frequency costs between $150 and $350. Then there
are antennas, feedlines, power supplies, etc for any of the above
combinations.

>6) Where can I find a source for newsfeed ? Is there any money involve for
>   newsfeed ?

It's illegal to charge money for any amateur radio activity. Finding someone local to give you a feed may be difficult as few hams are gatewaying the Usenet to amateur radio.

>7) I may move to Toronto or Montreal or Hong Kong. Is it possible to use
>   packet radio to access newsgroup at these cities ?

Amateur radio laws, and activity, vary from country to country. Canada has more liberal rules than the US. I can't advise about Hong Kong.

If all this sounds negative, it is. Amateur packet radio is fairly new, in a constant state of flux, and is saddled with many outdated regulations and practices. It's basically an experimental service at present with much hope for the future, but little current practical use for people needing either high speed or high volume service. If you want to be a ground floor developer, it's wonderful, but if you have a current practical communications need, I'd suggest the telephone network. Finding a dialup Usenet feed is not difficult.

I'm looking for feedback from people out there who have experience
with 9600 baud modems.
I want to purchase a 9600 baud modem to place inside my PK-232 that
would work with a Yaesu FT-2400 2 Meter xcvr.
Any suggestions ??
Rich

  I have been using 2m packet for a while now, and after much
experimentation have managed to figure out the basics. I've come
across any number of books on "How to get started in packet radio",
usually spending 5 chapters explaining the history, What is a TNC,
What License Do I Need, etc.   One or two chapters will explain how
to make a local contact in painstaking detail. Then, at the end,
there will be one paragraph on ROSE, one paragraph on Net/ROM, and
usually nothing on TCP/IP or BPQ.
  Could someone refer me to a book that explains the packet *network*
and high- and low-level protocols in detail? So far I have seen several
people mention how to get info on the AX.25 protocol from ARRL, but
no one has mentioned anything else. I really want a *single source*
for all this information, rather than having to build a whole library
of one-chapter-of-this-book, one-chapter-of-that-book. For example,
I have never even figured out what all the columns of information
returned from a "routes" command on a Net/ROM site mean. A decent
reference that skips the introductory blather would be welcome.

Sunday Sept 13, 1992 Kantronics will be presenting a FREE!!!

all day digital Seminar. If your interested in Amateur packet
radio be sure to stop by.

Sessions run from 9am till 5pm, with registration starting at
8:30am. Sessions will be held at the Radisson Airport Hotel
1375 Cassaday Ave, Columbus. 475-7551.

Sessions schedule.

9-10:30
Overview of packet radio. This is a basic intro to what amateur
packet is and its many uses.

11-12:30
Connecting your equipment. This session revolves around RS232 and
connecting your Terminal Node Controller (TNC) to various radio's.

1:30-3pm
Getting on the Air. How to make your first contact, basics of networks
and networking.

3:30-5:00
Open Form. Session will cover about anything you want to talk about
in digital communications. WEFAX, RTTY, ASCII, AMTOR and others.

Four door prize drawings will be held through the days.

Kantronics is a manufacuture of Amateur radio packet equipment.

Kantronics technical personal will be at Universion Amateur radio
Saturday Sept 12.

I am getting ready for a try to connect to Columbia (STS-47)
via packet radio. I use an old program to plot satellite
orbits, it's called GRAFTRAK II and requires CGA and 8087.

When entering keplerian elements, it prompts for "Orbit Base" with
the options of "perigee" and "equator". Given that the orbit
is a low eccentricity one, which otpion should I use?

I use the Keplerian elements published in Space News,
Sept. 7, 1992 by N5QWL and KK6YB.

Please answer by e-mail only, to this address:

kkrallis@leon.nrcps.ariadne-t.gr

as I have no regular access to Usenet News.

I am very interested in getting into packet radio. I currently don't have
an amateur license but am studying towards this at the moment. However, I
know relatively little about packet radio and general radio equipment. If
someone could either point me in the direction of useful info on this
or take the trouble to tell me something about it, I would be grateful.
I am particularly interested in info relating to the kind of services
available via packet, the price of packet and ordinary radio kit and
the kind of things that actually can/can't be done via packet.

Apologies if this is rather a newbie question, but then I am somewhat
of a newbie.

Grim...

Oh yes, I would mainly welcome info from people in the UK as things like
regulations and price is probably different elsewhere, however any relevant
info would really help.

Hallo, can somebody email me information about software distribution by radioco
mmunication. IBM is said to use sattelites for distributing it's software? Yo
u can also mail it to me : Lode Goukens Nachtegaalstraat 26 B-2060 Antwerp Bel
gium (phone 32 3 2268900) Thanks in advance.

Does anyone know of a place to ftp a apple 2 packet program?
This is to be used by WX3O to put up a station in Illinois.
Any info for apple 2 packet would be helpful. Send E-Mail to me for any
answers.

I've found KISS, TCP/IP, and terminal software for the Mac, but so

far not a BBS program. Can anyone recommend one, along with an FTP source? Many thanks, tom@thg.hobby.nl

In article <1992Sep4.133641.12681@ke4zv.uucp> gary@ke4zv.UUCP (Gary Coffman) writes:
>That, of course, is the problem with any amplitude modulated signal. The
>trick, as always, is to arrange for the symbol times to be different from the
>characteristic fading times of the channel. If the symbol time is dramatically
>longer or shorter than the characteristic fading time, then distinguishing
>real symbols from channel conditions is possible.

Yes, that's how CLOVER handles fades; a symbol rate of 200 bauds or less will be immune to 90% of all fades (Wiesner).

>I shouldn't be telling you how to suck eggs, you're the expert here,
>but I'd think that the kinds of post processing used on weak space
>signals should also work with Clover or any other modem modulation
>scheme.

CLOVER uses a Reed - Solomon Error Correcting Code; I'm not sure which code or how much redundancy is built in, but with RS, you can get one heck of a lot of coding gain for a very small percentage of overhead.

There was a blurbish article in _CQ_ a few months ago about CLOVER; it would be a Good Thing if the folks involved would publish more details.

Originator: jim@eddie

well, as the title suggests, I do in fact have several questions that I'm
rolling into one posting....

first, if I've heard correctly, there is some problem with getting Host
Mode software for some of the DSP-based packet gear (AEA is the one I was
told about). if anyone is interested in mailing (contact me first in case
I've already gotten a volunteer) a copy (e-mail, snail mail, whatever) of
the specifications for this particular Host Mode protocol, I would be
very interested in adapting KAMterm (the shareware Host Mode terminal
program for Kantronics TNCs I just put out) to support other Host protocols,
as well (in most cases, this should be quite simple).

now, on to more interesting things! :-) I've been hearing an unfamiliar
mode of operation in the AMTOR freqs on 20m since I got up on AMTOR, and
have yet to figure out what it is. it sounds like a cross between ARQ mode
and FEC mode --- roughly 1 second long bursts of what sounds like FEC, a
pause, and another burst. then, the station switches roles (I assume),
and starts sending very short bursts (still sounds like FEC) at roughly
1 second intervals.

anybody have any idea what this mode of operation is? I tend to hear it
toward the upper regions of the AMTOR freqs (usually between 14.075 and
14.082), not that this really means anything....

next question: does anyone know if the Kantronics All Mode (KAM) can copy
this? anyone know if it can actually work this mode?

thanks.....

I am also interested in packet stuff to make use of my apple IIc. I would be
glad to hear of anything around that I could ftp (or even RE-TYPE!) to use
the old IIc.

Thanks to all out there.

If all else fails, ignore what everybody says and what you read about
grounding and bonding, and disconnect them ALL. I have found that
sometimes, a poorly designed ground is worse than none, and with the
design of the DVR 2-2 and Kam, there really isn't any. The only other
solution would be to acquire some ferrite donuts, and get as many wraps
on the donut with the rs-233 AND audio cables. If that fails to reduce
or eliminate it, sell the kam and buy a Tapr Clone (or a real tapr2) if
you can find one :-) Of course, you couldn't play amtor/fax/whatever
else, but then a TNC is supposed to be for packet!

Honestly, the DSP-12 is extremely well made and housed in a structured
 aluminum housing. As far as the performance of the built-in modems go,
 I really have not tested them (I purchased the dSP-12 as a DSP software
 development system but never had time to use).

Here's how I delt with RFI in my packet station:
I used _long_ (like 20 feet or more) lengths of shielded cable between the
TNC and radio. Also placed the antenna about 25 feet overhead from the
room with station (up on the roof). I also used _seperate_ power supplies
to drive the radio and the TNC.
You might be able to tweak the TNCs xtal oscillator(s) to move a harmonic
off the receive frequency (145.01 in your case), if the above suggestion
isn't workable (like no access to a roof). Of course, you'll trash another

frequency, but that might be acceptable for your purposes (not a high
quality solution, though).

Hello All,
     I am the Director of the Association that decided to pull the plug over
the labor day weekend. I must make some corrections which were entailed in
a bulletin to the local area....I'll point out below...

>Date: Thu, 3 Sep 1992 15:17:01 GMT
>From: spsgate!mogate!newsgate!usenet@uunet.uu.net
>Subject: Shutdown protest??
>To: packet-radio@ucsd.edu
>
>Greetings all...
>

>There was a message on the local PBBS's that one of the groups in our area
>(Phoenix, AZ) is going to shut down all their BBS's, nodes, etc. over
>the Labor Day weekend to protest the ARRL position on unattended
>forwarding. They seem to think this will "send a strong message to the
>ARRL".
>
>Seems kinda stupid to me. Seems like they will be only proving that the
>world can get along just fine without packet forwarding, which I would
>think is exactly the opposite of what they want to show.
>
>Is this a widespread protest this weekend or just an isolated group?
>
>73....   Mark   KG7JL

The purpose of the Association shutting down the systems were for 3 of
the following most important reasons:

1. NOT TO PUNISH the ARRL- Yet to "WAKE UP" the end user that sits back and
takes the wait and see attitude until it is too late...Well folks, this is
exactly what happened....The ARRL put out a questionaire in the QST and hardly
any of the normal users of such networks responded...even worse, some of our
STA folks didn't respond....We MUST TELL the ARRL what we want....We were aware
of the ARRL's change of mind before the "blackout", however, we figured that
if we decided to not do it, well the end user will most likely say "well looks
like it's under control, nothing for me to do now" I must personally say
"WRONG"...This is just like our political government...If we DON'T VOTE we
don't get what we want!

2. This was more of a simulation as to what would happen if our STA stations
were placed under the constraint that the ARRL digital committie has proposed.
So with a dent in that traffic flow, alternate land SLOW 1200 BAUD routes must
be taken to get to that DX DESTINATION....Often being either lost or taking
several days to arrive...

3. To show OUR SUPPORT TO HF STA SYSOPS who work to see traffic MOVE!

So far reaction has been positive....I must honestly say, there are those that
still think we were wrong, however we are in America and your entitled to your
own opinion...In the future I certainly hope that we don't have to come across
things like this again....

and just to close and say again "THIS BLACKOUT WAS NOT TO PUNISH THE ARRL OR
MAKE ANY STATEMENT TO THEM---Simply for the END-USER!"

73 de Dan N7MRP

You don't say what you are using for the RF side of things. Get your antenna as far away from the Terminal equipment as is reasonable. Like 20 feet at a minimum, outside the house on the other side of walls (with foil insulation or stucco wire in then is even better). Most of all succomb to trying HTs sitting on the monitor, I for one have never been able to make close proximity between RF and terminal work. For REAL strong locals, I have had moderate success with a mobile mag mount 1/4 wave antenna stuck on a file cabinet about 12-15 feet (limit of coax) away from terminal work.

Good Luck, Dave

I found a file at UCSD.EDU called TFPCX.ZIP, under TCP/IP and BAYCOM.

The document with it is in German, and I unfortunately, am not fluent in German
but I am guessing that this is a TSR so make the Baycom modem appear to be
a TNC is KISS mode. This would lead me to think that I could run TCP/IP,
with perhaps GRINOS, with the Baycom modem. Does anyone out there know if
I am on the right track, or only wishfully thinking? My configuration
for packet is currently a Baycom modem with Baycom 1.5, but I have been
looking at the GRINOS version (PA0GRI NOS) for TCP/IP. Any helpers or
at leat clues would be appreciated. Thanks.

Hello all packeters,

First:

I have Release 1.1.6 on my TNC2
(TINY-2 10/18/88 32k ram UK Siskin Electronics)
whith personal BBS.

But, i need manual for some differents commands :

PERSIST, PPERSIST, PIDCHECK, SLOTTIME, STATUS, TXUIFRAM,
3RDPARTY, CWID, CWTLG, CWLEN, CWIDTEXT, KISS

Where can i found it?

(i have only manual for 1.1.5)

Second :

When monitor is ON, nodes traffic will
cause dammages on my terminal, because some word in the packet
have the bit 8 to hight.
The TNC don't filter this bit and transmit to my terminal a code

without this bit.
expl : bell char is $07 (in ASCII), when on the air there is a $87, i have
a 'beep' on my terminal because it receive a $07.
Others chars would broken my terminal configuration... and
the MF commands (filter) would only cut chars from $00 to $7F ....

What can i do ?

Third :

Where can i found Release 1.1.7 for TNC2 or clones ?
(I have already found TAPR Release 1.1.8 on UCSD.EDU)

Many thanks for all informations.

serveme!uumeme!jrapacz
From: jrapacz@uumeme.chi.il.us (Justin Rapacz)
Subject: What Type?
Organization: UUMEME Public Access UNIX
Date: Wed, 09 Sep 92 23:56:51 GMT
Message-ID: <1992Sep09.235651.27200@uumeme.chi.il.us>
Summary: What are all these types of radio's, PLEASE HELP!
Lines: 19

Well, I am new to all radio except cb. I hear all these hams and other people
that are really into this stuff, and..well, I'd like to get into it too. I've
seen tons of different types of radios, like ham, satalite, tv, packet, etc.
I don't know which does which and which is the best. I would like to know
is there is a "universal" type of radio system that can communicate with all
different types of radio. If not I would like to know which one can go the
farthest and has best reception. I really dont think one of those giant
antennas on top of my house are what I want, so how about a compact satallite
system. And while I'm at it I might bring up, I am affiliated with a
detective agency who's is looking for a new way to communicate over long
distances by radio. I would like to know what is the best way to do this.

Also, whatever type of radio I get into, I will be needing a tutor, any volenteers?

Does anyone have any comments re: the AEA PK-88 vs. the PaComm TINY/2? I've decided to buy one or the other of these low-end TNCs for VHF/UHF use and I just wanted the net's expert opinion.

Subject: KAM documentation

I just purchased a used KAM. The original owner got it with the version 2.85 ROM, and the documentation is all for version 2.85. It has been upgraded to version 4.0 but the only documentation for the upgrade that came along with it is a version 4.0 Update Cover Letter and replacement pages 30A - 30D for the Operations Manual. There seems to be a substantial amount of information missing -- there a quite a few commands listed in the Commands Manual that don't seem to exist and there are quite a few commands that appear on the Help listing which aren't documented in the manuals I have. Can anyone tell me if there is

a version 3.0 manual set or update that I am missing, or refer me to
some other source of info on the changes?

I would also like to hear from someone who has upgraded beyond version
4.0 (is 5.0 the latest version?) about what the current version does so
I can decide whether I want to pay to upgrade my unit.

Please reply by e-mail, I'll summarize to the net.

Thanks and 73

TS>I am about to buy my first handgun. I thought I wanted one for
TS>occasional practice, and to have on hand for home defense, in case all
TS>hell breaks loose in this society (p > .00).

TS>What about a .22? Can you do semi-serious target shooting (whatever
TS>that is) with a revolver? If not, what's a good .22 auto? I have
TS>heard positive things about the Ruger Mark II, but much more about the
TS>S&W Model 41 ($$$).

Since you're most comfortable with revolvers, there is NOTHING wrong
with a Smith K-22. Perhaps not QUITE so precise as a semi-auto for top
echelon target shooting, but for practice and familiarity with, say a
Model 19 or 686, it would be ideal. K-22s are excellent revolvers.
Another (cheaper) alternative might be the nine-shot Taurus target .22
revolver, which seems to be a good value and of nice quality.

I can't advise you on the M19 vs. the 686. My "mainstay" .357 is an
ancient N-frame (M27) pre-war Smith... a huge old beast but sturdy and
accurate. I'm also partial to the Ruger Security-Six, but they don't

make those anymore either...

The first ACSB repeater in Los Angeles, mabe in the country, on the 2 meter HAM band went active on Sept. 7 1992.
The repeater is located 5670 feet above sea level on Sunset Ridge in Eastern L.A. county.
It is an open repeater the input is at 144.895 and the out put is at 145.495 no pl is required but a pilot tone is, in order to take advantage of the compandering that is built in to the unit.
Anyone with or with out ACSB equipment is welcome to use the machine. You can listen to the output with a multimode rig or any single sideband rig that will tune the 2 meter band. You will be able to talk thru the repeater If you mix a pilot tone of 3100 hertz , (10 dB down), with your microphone input to your single sideband rig. If you wish more information on how to use the repeater or to setup your own, how to get a rig of your own feel free to call me at area code (310) 333 7389.
Also digital modes work very well as longe as the band width required is in the 3 kHz range. Packet ought to get a real boost in thru put due to the linking of both the receiver and transmitter. I have not tried digital yet. If you do remmember to set your tx/rx delay longer than 250 milli seconds.

Hello Greg,

Sorry for replying to the whole group, but I was unable to reconstruct the proper email address for Greg.

> I use two computers when I packet. These are IBM386 (usualy with SP5) and
> Amiga2000 (with AHP software). I am also interested in exchange of software for

> these two machines.

I use an Amiga 500 and a Tandy 200 for Packet Radio. I have never heard of AHP software. Could you describe it further please? For Packet, I use Jr-Comm (regular Term Program) and AmigaNOS (Network Operating System) and would be willing to send you these if interested.

Greg, please reply to me direct! My Bitnet address is: bad1679@ritvax and my Internet address is: bad1679@ultb.isc.rit.edu.

Thanks and 73/55 de Bernie NU1S/OK8EAS

I'm currently running AA4RE's REBBS system on my BBS and have found it to be a very well-designed feature-rich program. The only problem I have had with it is that is is not extremely reliable (i.e. no error handling when a TNC gets reset out of host mode or something).

One feature I have seen in the F6FBB software is a streamlined compressed-message forwarding protocol (among other things). Before trying that system out, I wanted to gather some feelings from other SysOps currently using this software as far as reliability, SysOp features, and especially how the USER interface is.

Feel free to reply to this article on the net rather than via E-mail if you like.

Hello packeteers. I'm writing this question on behalf of a club station
at our University which seeks to put 9600 baud packet on the air using a
440 link to the wide-area digipeater up there. Could you please drop me
a line as to what rigs you are using successfully on 440 for that speed,
and if you had to do any modifications to the radios themselves before
your efforts were met with success?

The club station has to put its paperwork together to get its 'slice of
the pie' in funding by 18-Sept-92, so there's only a week of time to get
your ideas in to us. Although I'm sure a few people use those all-mode
440 rigs for things like PACSATs and the like, they're not going to be
able to get *that* kind of funding! If your success was with things
like the off-the-shelf Alincos, Icoms, etc. in a range under $400.00
that would be great!

E-mail to me would be preferred, but I do read the group regularly and I
would be happy to summarize responses later. If this question has
already been addressed in recent months, then (a) I missed it, and (b) I
apologize for the duplicate traffic. Thanks, and best 73s to you all.

Nope; "digital" != "discrete samples."

"Digital" means "represented by digits (numbers)", period.

I need to get an IP address (and list of common frequencies) I can use for
packet radio at 1200b on 440MHz and 2mtrs. I have KA9Q and TCP/IP for Xenix
to allow me to put email and archives online. Our facility has a class-C
address from our IP provider, but I need an ampr.org address for the nodes
we will put PK-88s on. Please help me help others! Thanks in advance...

Whoa, maybe Justin would be interested in Amateur Radio, for the right reasons if he had a tutor. Someone nearby ought to "Elmer" him until he decides if he finds the hobby interesting enough without the commercial side of things.

John

I'm currently using an internet/packet 'gateway' in No. Cal. To get full details and instructions, simply drop a line to

gateway-request@arasmith.com on the internet.

Good Luck,

Todd Hale
a satisfied gateway user :-)

My father (WA1ETX) recently (3/92) purchased an MFJ-1278 with MultiComm software. So far it has been a very nice setup to work with. Except for a little battle we had with it a month or two ago - sent it back to MFJ for a free firmware upgrade. However, yesterday we discovered that you can only convert a CGA image to SSTV with the 7-month old software that we have. So I decided to call the MFJ tech support line and ask when a new version of BCDSSTV (converts an MFJBCD screen dump to SSTV format) is coming out that supports EGA/VGA. The guy said it will be released as an update in 2-3 weeks, to keep an eye out in QST. Just for yucks we looked at the latest copy of QST, and sure enough it is in there (MultiComm v2.2). Here's the kicker: it costs another $24.95 + shipping. *GRUMBLE*

No question, just felt like letting off a little steam somewhere. :)~
I would still reccommend the MFJ-1278 if you are looking for something that does everything (packet, fax, sstv, etc...). They (MFJ) do, however, need to do some hefty work on their software, it's very 'messy' (misspellings, etc). Stuff like that should be corrected before a piece of commercial software is sent to a customer!

Darnit, I did have a question. We heard that someone had written a shareware
program to control the MFJ-1278 that costs $5 or something to register. Anyone
else heard of this, and know where I can get it? I've already checked the
usual ftp sites (wsmr-simtel20.army.mil and wuarchive.wustl.edu) under
hamradio and packet and didn't find anything. Thanks in advance!

Can anyone recommend a source for the G3RUH (I think that's correct..
correct me if I have it wrong) 9600 bps modems? Or does anyone have one
they want to sell? TAPR has one that is compatible...any
experience with it? I'm planning to use it in my PK-88. A kit would
be preferable but an assembled unit would be OK too.

Any info will be appreciated.

Thanks & 73...   Mark   KG7JL

: Well, I am new to all radio except cb. I hear all these hams and other people
: that are really into this stuff, and..well, I'd like to get into it too. I've
: seen tons of different types of radios, like ham, satalite, tv, packet, etc.
: I don't know which does which and which is the best. I would like to know
: is there is a "universal" type of radio system that can communicate with all

Nope - there is no such beast. Some radios have a number of different modes
available, but none of the have all possible modes included.

: different types of radio. If not I would like to know which one can go the
: farthest and has best reception. I really dont think one of those giant

This depends on the time of day, time of year, where we are in the solar
cycle, how the sun is acting at the particular moment, frequency band, where
the transmitter and receiver are located, among other factors.

: antennas on top of my house are what I want, so how about a compact satallite
: system.

Generally, the more metal you can get in the air, the better - for purposes
of reception. If you want long range, then you usually need large antennas.
At the moment, this is even more true of satellite communication.

:   And while I'm at it I might bring up, I am affiliated with a
: detective agency who's is looking for a new way to communicate over long

: distances by radio. I would like to know what is the best way to do this.

It is probably best to forget it. 1) without going to a lot of expense, you cannot make the communications private - anyone who wants to listen in may do so. 2) no long range radio communication system is reliable - with the possible exception of satellite communication. Satellite usage is expensive. It is also not secure without expensive encoder/decoder setups.

Most types of radio communication require licensing. The only exception, here in the US, is Citizen's Band Radio. It is not reliable for talking across town, much less long distance.

You can forget Amateur Band Radio - where most of the packet communication traffic is. Commercial usage of the band is strictly prohibited - and enforced.

: Also, whatever type of radio I get into, I will be needing a tutor, any
: volenteers?

I would suggest you forget it. Either use scrambled cellular phones, or rely on normal telephone lines.

Even if you could get a license for long range radio communication, the most you could do is operate the equipment under the direct supervision of a First Class Radiotelephone Licensee.

Bill

Good morning. It's Sunday the 13th of September and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The 1992 Young Amateur of the Year has been chosen; and we have full details of this year's RSGB HF Convention.

This year's holder of the prestigious title Young Amateur of the Year is a seventeen-year-old A-level student, Martin Saunders, G7JCJ, who comes from

Broadstone in Dorset. Amongst his achievements have been building a Packet Cluster node to help local DXers, being elected Secretary of the Southern Users Network Packet Group, being in charge of radio communications in his scout group and solving radio-related problems on his school weather satellite station. Martin is a member of the Flight refuelling Amateur Radio Society. He receives prizes from the Radiocommunications Agency, the RSGB and the professional and amateur radio industry. The runner up was sixteen-year-old Neil Mothew, G7NGM. He is a very keen constructor and even designs his own printed circuit boards. He is a member of the Loughton and District Amateur Radio Society. The Young Amateur of the Year award is part of the RSGB's Project YEAR initiative which aims to encourage youngsters into amateur radio and, ultimately, into the electronics industry. This is the fifth year of the award which has been generously supported by the Radiocommunications Agency and industry. The prizes will be awarded at the RSGB's HF Convention.

This month sees the premier event in the HF DX Calendar:

The RSGB International HF and IOTA Convention will take place on Saturday and Sunday, the 26th and 27th of September, at the ICL Beaumont Conference Centre, Old Windsor, Berkshire, a new venue. Over 100 DX amateurs from over 20 countries, including the CIS, are planning to visit the UK to attend the Convention which starts on the Saturday at 0915 with talks and lectures on the RSGB's popular Islands On the Air (IOTA) award programme. A DX Dinner will be held on the Saturday night. On Sunday, a full lecture programme includes well-known personalities Peter Hart, Mike Grierson, Peter Chadwick and Ross Clare, covering HF technical issues such as transceiver performance and construction, SWR and linear amplifiers. EMC will be discussed by Robin Page-Jones, the HF Contest Forum will tell you how to win HF NFD, HF trophies will be presented, and the latest contest logging software will be on show. The UK DX Packet Cluster Group will be demonstrating how to use this DX Information system and David Rowley from Strumech will talk about selecting and using your tower safely. There will be the opportunity to try on air the latest HF equipment and the current versions of DX software. The lecture stream includes talks on expeditions to the Pacific, the Indian Ocean and Clipperton. There will also be an RSGB Bookstall and tea and coffee is free. Overnight accommodation is available. For full details, see the September edition of Radio Communication, page 15, or from Bob Whelan, G3PJT, on 0223 263137 or via the DX Cluster.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From St Pierre and Miquelon, SP5SS will use the callsign FP9SPM from today for 4 weeks, with emphasis on CW. From Ecuador, HC3AP will be active on 80 metres daily until the end of September. Operating times are from 0000 to 0500 GMT around the frequency 3780 to 3800kHz. From Brunei, G3TXF hopes to operate as V85XF from next Thursday the 17th to Sunday the 20th. Emphasis will be on the HF WARC bands, using CW only. From Cocos Island, VK6XW will sign as VK9CW from now until the 26th of September.

Rally news now and we know of four events for today Sunday the 13th.

The British Amateur Radio Teledata Group Rally is being held at the Sandown Park Exhibition Centre, Esher, Surrey. The location is well signposted and is

some 10 minutes from junction 10 of the M25. Doors open at 10.30am. The event features over 250 tables, including top companies, special interest groups and a bring and buy. Refreshments will be available and there is a large parking area. Talk-in channels are S22 and SU22.

The Lincoln Short Wave Club Hamfest is being held at the Lincolnshire Showground and Exhibition Centre, which is 4 miles north of Lincoln on the A15 road to Scunthorpe. Doors open at 10.30am. There are all the usual trade stands and a large bring and buy stall. Refreshments are available and talk-in is on channel S22.

The Madley Satellite Earth Station Amateur Radio Group Radio Car Boot Rally is being held at the Sports Ground in the Satellite Earth Station Complex, located 7 miles south west of Hereford. Gates open at 9.30am. There will be all the normal attractions, including a bring and buy stand. There is ample room for free parking and picnicking, including a special parking area for disabled visitors. Talk-in is on channel S22 via G7BTI.

The Telford Amateur Radio Rally is being held at the Telford Exhibition Centre, Telford, Shropshire. Doors open at 10.30am. There are trade stands, club and special interest groups stands and a bring and sell stall. There are some very large free car parks and talk-in is on channel S22 and via GB3TF on channel RB8.

There are two events for next Sunday the 20th of September.

The Centre of England Autumn Radio Computer and Electronics Rally is to be held at the National Motorcycle Museum, Bickenhill, near the National Exhibition Centre, off junction 6 of the M42. Doors open at 10.30am, or 10.00am for disabled visitors. The event features over 60 tables. Refreshments will be available and there is a large parking area. Talk-in will be on channel S22. Further details from G4UMF by telephoning 0952 598173.

The East of England Radio Rally will be held at the ICI Building, East of England Showground, Peterborough. Doors will open at 10.30am, or 10.00am for disabled visitors. There will be trade stands, a bring and buy stall and a radio-and-electronic car boot sale. Refreshments will be available. Further details can be obtained from G0CVZ by telephoning 0733 222588.

Contest news next:

Next Tuesday the 15th, the second of the RSGB QRS Cumulative contests takes place. These events feature slow Morse and further details can be found in July's RadCom. The next RSGB VHF event is the 144MHz CW Cumulative which runs from 1930 to 2200 GMT next Wednesday the 16th. The RSGB 70MHz Trophy and SWL Contest is on Sunday the 20th of September and runs from 0900 to 1600 GMT. See June RadCom for further details.

Here is news of some of the special event stations on the air this week:

As part of the Orkney Science Festival, which lasts until next Thursday the 17th of September, the call sign GB2OWM, Orkney Wireless Museum, will be aired between 2 and 5pm on weekdays and 10.00am to 5.00pm on weekends. The Museum is

situated in St Margaret's Hope on the Island of South Ronaldsay. Operation will be on the HF bands. The RAFARS will be operating the special event callsign GB1BOB, on Saturday the 19th of September, from RAF Leuchars during the annual Battle of Britain Open Day. The stand will comprise an operating position, static displays and an RAFARS stall. The Wrexham Amateur Radio Society will be on the air during Saturday the 19th and Sunday the 20th, using the Special callsign GB4WXM, from Erddig Hall, near Wrexham as part of the Scottish Tourist Board's National Trust Celebrations. Operation will be on the HF bands. The Manchester and District Amateur Radio Society will be airing the Club callsign, GX3HOX next Sunday the 20th of September to celebrate the 100th Anniversary of the Lancashire Cricket League, during the Rawtenstall Cricket Club Fun Day. The venue is the Worswick Memorial Cricket Ground, Bacup Road, Rawtenstall, Rossendale, Lancashire. Further details can be obtained from G0SAD by telephoning 061 336 7469.

And now the solar factual data:

This week we have caught up with all of the missing data due to the holiday. The extended period 27th of August to the 6th of September saw the more active side of the sun coming into view. Generally solar activity was moderate up to the 1st of September, then geomagnetic activity increased up to sub-storm levels and by the 3rd full storm conditions prevailed. Levels were declining by the 6th back to very unsettled. However an M4.0/1N flare occurred on the 5th followed by two more M flares and two X flares up to an X1.7/2B on the 6th. There have been numerous Sudden Ionospheric Disturbances and Short Wave Fade-outs. Sun spot means over the period were 63. The solar flux levels averaged 104 units, and had steadily risen from 94 units on the 27th of August up to 139 units by the 6th of September. Geomagnetic activity was unsettled up to the 1st of September, then by the 3rd had reached storm levels with an Ap index of 53 units. This slowly declined by the 6th to unsettled levels of 17 units. However, further X flares on the 6th seem set to continue the disturbed conditions. The radio quality indices were slightly below normal up to the 2nd then collapsed to very poor by the 3rd and had not recovered by the 6th. The aa indices, as supplied by the British Geological Survey for the period 25th to 31st August, were quiet. The daily levels averaged only 15.4 nanoTeslas - about K3. The 31st was very quiet with a reading of only 8.2 nanoTeslas.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 6.7MHz but the 31st of August and 2nd of September were up to 8.0 and 9.1MHz. This dropped to only 5.9MHz by the 3rd of August with the disturbed conditions. The darkness hour lows averaged 2.8MHz, but varied from 3.5 down to 2.0MHz over the period.

Now the ionospheric data for the north:

We have only a small amount of Irkutsk data this week. The F2 daytime critical frequencies at Irkutsk averaged 6.5MHz, and the darkness hour lows 2.3MHz. Due to problems with the phone line between Slough and Appleton, the ionospheric data from Slough is now being interpreted by computer program. This is why no other phenomena such as Spread F, absorption, and so on, is being reported.

And lastly the solar forecast:

This week, the quieter side of the sun will be coming into view. Solar flux levels are expected to be at about the 100s. Geomagnetic levels are expected to be quiet at first, increasing to very unsettled by the 20th. Daytime ionospheric levels are expected to reach 24MHz with north/south paths being best. The darkness hour lows should be about 21MHz, but 14MHz should be best for East/West paths around midnight.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S J and G7 N P series, and Novice calls in the 2 0 A D and 2 1 B B series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Summary: Reposted by Keith Petersen

I have uploaded to WSMR-SIMTEL20.Army.Mil:

pd1:<msdos.packet>
KTTRM100.ZIP   NON-HOST packet term. prog. based on KAMterm

KTterm is based on another recent development of mine, KAMterm, which
is a full Host Mode terminal program for the Kantronics line of TNCs.
As it turned out, users with non-Kantronics TNCs wanted to take
advantage of the features built into KAMterm with other brands of TNCs.
KTterm is the result of their requests. While this program cannot
begin to match the power offered by KAMterm, it does provide some
interesting features for non-Host Mode communications.

Major features include:

*) Ability to create startup and/or exit command files that will
   configure the TNC for you.

*) When logging to a file, KTterm will try to keep things organized by
   adding a line above any text it logs indicating who said what.

*) Scrollback buffers are setup for each window if memory permits. Size
   is adjustable via configuration file.

*) KTterm will notify you of incoming connects.

*) Programmable function keys

*) Macro command files

*) ``Brag'' files supported

Hey Al, glad to hear that you got a KAM.
I have run KAMs for about 4 years now. I
like them very much. I am running version 5.02 with
HostMaster II+. It is a windo affair that lets you work
Packet on the vhf\uhf side and Cw etc on the HF side
and you can see all that is going on at once.
I can't help you with the DOCs. I would suggest that
you contact Kantronics. If you order the 5.02 upgrade
and tell them that you need the DOCs on the Kam
they will send them to you. I have had VERY godd service
from Kantronics.
They advertise in all the Ham magazines.
Tel 913-842-7745 BBS 913-842-4678
Hope this helps a little.

>
>"Digital" means "represented by digits (numbers)", period.

  More nits -- or at least questions:
   If "discrete samples" aren't digital, are they analog?
   Is time-sliced analog (PAM) still analog?
   Is CW analog, or digital? Can't digital "encodings" be
     something other that binary -- for example, a "dot" vs. "dash"
     is distinguished by duration, but carries binary information.
   Could CW be binary information (coded), using analog for transmission?

If so, isn't all a lot of "digital" communication really analog
carrying binary information?
Can a signal be both "digital" and "analog" at the same time --
for example, "digital" data in a non-picture portion of NTSC TV?
Is the off-hook signal on a telephone line a digital signal?

If this is re-starting an old, religious debate, just let me know how it ended.

Al Varney

> Al Woodhull, N1AW @ K1MEA.MA
> awoodhull@hamp.hampshire.edu

I had a similar experience when I upgraded my KPC-2400 from Rev 2.35
to Rev 2.85. When I installed the new PROM, my station wouldn't
connect to any other stations anymore. Then I found that many commands
had been removed, others added, and many of the rest changed somehow.
Most of these changes were not even mentioned in the addendum. I
reinstalled the old PROM, and wrote a letter to Kantronics describing
my experiences and to ask for a copy of the new command manual.

The reply stated that the addendum that came with the new PROM was
basically the changes to the Rev 2.70 manual (which I didn't have).
They did offer to sell me a current copy of the Installation,
Operations and Commands manuals as a set for $15, or about the same
price as the new PROMs. I was NOT pleased. I found another source for
the documents I needed.

That convinced me that the next time I upgrade, I'm going to find
another source for the PROMs and command manual. It's not that hard,
and would be a good deal cheaper.

This happened a few years ago, and I still get burned up about it.
I've not seen nor heard anything since to make me change my view.

I don't have the previous revision of the command manual. The TNC is
already installed, and I already know how it operates, so I don't need
the full set. Why can't venders like this just include the current
commands manual with the new PROM?

Are you listening Kantronics?

Current versions of publicly-released Gracilis bits should be on col.hp.com
[15.255.240.16], in the directory packet/gracilis.

INSPECTOR for FBB mailbox v.920814:

What it does:

With this programme you can find messages that contain obsene words
or where somebody tries to sell or buy something on ham radio (illegal
in most parts of Europe).

How it does it:

When a message is received by FBB mailbox this programme (M_FILTER) is
automatically called. It checks line by line if sertain strings of
letters (words) are found. These strings are read from the file
M_FILTER.WRD. If one or more of them are present in the inspected
message, a notice of this is written to C:\FBB\WAITING.IN.
Another programme called MF2MAIL checks if there is a file WAITING.IN
and if it finds the file it moves it to the end of the FBB mailbox import
file MAIL.IN. MF2MAIL is activated with the CRON.

How to install:
---

1. Copy M_FILTER.EXE to \FBB\BIN or any directory in the PATH.
2. Copy MF2MAIL.EXE to \FBB\BIN or any directory in the PATH.
3. Copy M_FILTER.WRD to \FBB.
4. Add the following lines into Cron.sys:

```
IF H 3,8,13,19
```

```
                        X MF2MAIL
                ENDIF
```

   (of course you can change the times or the frequency if you like :))
5. Edit the file M_FILTER.WRD if you like.

Where you can find this programme:

Use anonymous FTP from nic.funet.fi
directory: pub/ham/packet/bbs/fbb/util
By the way the source code in Turbo Pascal 6.0 is included.

Hello All!

Forgive me if this post seems out of place, but I am posting this message to
many different newsgroups in hopes of a positive response.

I am looking fo a rare U2 single, a DJ/collectors white vinyl 12" single of
Zoo Station. The single contains 3 songs:

              Zoo Station
              Lady with the Spinning Head
              Zoo Station (UV1 remix)

If you have this single, know someone who has it, or have seen the single
anywhere (I think it was released only in the U.K.), PLEASE respond to me
personally via e-mail (as I probably do not regularly read this newsgroup)
at the following address:

              jalapeno@leland.stanford.edu

ANY information on the whereabouts of this single, no matter how insignificant
it may seem, will be GREATLY appreciated.

Taanx in advance,
Jalapeno

     If you are talking HF packet DX, my limited experience with it has led
me to the following conclusions. Most HF packeteers are interested in passing
traffic or such and are not interested in keyboard to keyboard contacts. HF
packet is very very slow, with retries out the gazoo! I would recommend your
going with AMTOR instead if you really want to play with digital DX.

A local friend is trying to get on packet/packetcluster (tm) and bought
an MFJ 1274 TNC. I had told him to make sure the MFJ he bought was the
one that would operate at 2400 baud (1278 or 1274 T??), and he got the
wrong one. It appears that the stock 1274 needs an external modem to run
2400 baud. Any suggestions out there for external modems?
Thanks for your help! 73, Tom WB4IUX

Oh geez. I've been waiting for somebody to try this, because it's certain to create an escalating measure-countermeasure war (and associated flamefests) that should keep amateur packet radio buzzing for quite some time. And here I was afraid the nets might run out of things to send. (Please note the sarcasm in this paragraph.)

I wonder if this program will successfully parse the words in the following:

or this:

66 6f 72 20 73 61 6c 65 0a!

and then decide to let this message pass because it understands that this is a discussion *about* programs that censor such traffic, and not an actual, verboten, for-sale message?

I'd also be interested in knowing how this program can be legally sent over amateur radio given that it must contain a list of the "seven dirty words" that cannot be used over ham radio. Even if they're encoded in something other than plain text, the rules do ban language that is obscene *in meaning*, no matter what form it takes...

There has been quite a bit of discussion concerning internet gateways.

What security methods (or lack of) are being used to prevent people
from grabbing a known/heard callsign and then doing nasty things?

Most of the internet sites in Columbus are very cool when approached
about allowing gateway operation over radio.

Thanks Greg.

What types of policy problems have Internet/Packet gateway operators had to
deal with so far? I have heard some news on newsline about this within the
past year, but I wasn't paying close attention then.

Please respond by email and thanks for your comments.

Hi all,

     Sorry if this is not the place to post my question but it's a start.
I have a friend into ham radio who I think might be into this packet thing. The
reason I think this is because once while I was at his home looking at all of
his gear, I watched him turn on an old TV and do a couple of other things and
when the TV warmed up, there was a message coming accross the screen he said
was from another ham.

Q1) If this was a packet radio setup he had, how can I reach him? I do know his
    call sign.

Q2) Assuming he is reachable, can it be done through internet?

Q3) If I am on the wrong newsgroup, could someone direct me to the correct one?

Please accept my apology for being ignorant on the subject, and thanks in
advance for any information provided.

I find it slower than novice cw, and most stations are
automatic and do not answer calls. Gerry K8EF@W8CQK.OH.USA.NA

gerry@bluemoon.rn whose home bbs has trouble getting the
mail out sometimes, so it may go here instead.

> Thanks for your help! 73, Tom WB4IUX

I would suggest returning the 1274 to MFJ for a merchandise credit towards the better TNC (i.e. 1278 or 1274 Turbo). The price difference can't be that much. One device that does it all is always better than worrying about two devices. *smile* Of course, if your friend insists on running out for a 2400 baud external modem they are fairly cheap. Don't pay more than $70-80 for it, TOPS! I bought an ibm internal modem 3 yrs ago for $79... He can probably find a used one for next to nothing since everyone is upgrading to 9600 there should be plenty of 2400's for sale...

Looking for information on how to direct connect to the modulator and detector of the ICOM 271/471 for running 9600 Baud FSK packet on the ham satellites? I will be using the TAPR 9600 Baud modem kit.

Also looking for any mods that might improve the 9600 Baud performance of these radios.

Please reply directly to me at address below.

Anyone running a Packet BBS under UNIX ??

I have been running W0RLI's software under DOS/DesqView for
about four years. I would like to load UNIX on my 386
(Linux, specifically) but I don't want to have to take the
BBS down.

Any words of advice from someone who is (or has) actually doing this?

Thanks!
Monte

The internet/packet gateway policy can be briefly and succinctly summed
up as

   1) the internet doesn't care
   2) it's your licence

DOes anyone have a copy of TPK the FBB User Terminal Program? I have a French
copy, but since I don't read, French, it isn't much help. The docs in English,
would be nice.

I though Brian summed things up very well..... Do what you want to do
with the gateway. but keep in mind the RF side of the gateway is
where the FCC would be visiting.

English docs for TFPCX.ZIP?
Does anyone have an English translation of the German documentation for
TFPCX.ZIP? This package was posted on UCSD.EDU and seems to be another
packet driver to allow the BayCom modem to be used with NOS.

Attempts like this are bound to fail. How about this one:

"Fun queue. Ah! Sole!"

That's what Schwarzenegger *really* said in Terminator I.. Or, gee, maybe
it was something overheard while waiting for a table at a seafood restaurant?..

I've got a boat. Four sail. Ten thousand dolors.....

Touche! I was so busy thinking up clever ways to evade this thing, I
completely forgot that its biggest problem is that the average ham
can't spell or type worth a 64 61 6d 6e (don't want *this* to get
filtered out!!) :-)

I can see it now...serious papers at the ARRL Computer Networking
Conference on a filter with "ROT-13" functionality for ham radio.
Incompatible, of course, with anything outside ham-radio. Then someone
will discover the "plain text cipher" programs that appear on
sci.crypt occasionally. The ones that encode encrypted information in
what appears to be the running commentary from a baseball game. Or as
writings by the author Senator Biden plagiarized in his youth. :-)
(Senator Biden of Delaware sponsored some ill-fated legislation in
early 1991 that would have restricted or prohibited the private use of
cryptography over common carrier facilities.)

I would like to bring up a TCP/IP subnet on packet radio in my area. The address coordinator for Virginia (Not DC) has apparently moved and I have not been able to identify his new address or replacement.

If anyone can assist me in locating the TCP/IP address coordinator for the state of Virginia I would very much like to hear from you.

Thanks in advance.....

How "anthropomorphic" of you. Thanks very much. Now I understand.

Now why would the FCC be visiting? And what would they be visiting?
(You "though" wrong. I'm not looking for trite answers... I'm asking for
real experience, so don't bother responding if you have nothing more to add.)

Why, it's obvious. It's a Sports Data Radio. You plug in an antenna,
apply power, and tune to the nearest sporting event being broadcast.
Sports data are automatically collected and transmitted via the db25
data connection to your computer for storage and analysis. :-)

Does anyone know if a special cable is required to connect an Alinco DR 112
to an AEA PK232?

I constructed a cable as described in the PK232 manual for the DR 110 -
which is just a straight-through cable.

Everything worked fine for several weeks until one day the radio stopped
working. It would neither receive nor transmit (the 'on air' notice did
show up, but the 'power out bar graph' did not indicate any power out.

I double checked everything, including the antenna - it all looked fine.
I disconnected the TNC and hooked up the mic and still nothing worked.
The next morning the radio worked fine with the mic but as soon as the
PK232 was connected and tried to transmit the radio stopped working.

The radio went to the shop, and after sitting around for a week it was
finially examined. Needless to say everything worked fine.

I got it back last week and it worked fine both on voice and on packet;
until last night. This morning it worked again with the mic but as soon
as the TNC was hooked up it stopped working.

I'm beginning to think that the cable for the DR 112 might be different
than the one for the DR 110. Or perhaps something is wrong with my PK232.
Any help would be greatly appreciated.

From the doc-file of tfpcx 2.00:

  Das TFPCX dient nicht zum Betrieb mit TNCs im KISS-Mode (z.B. PK232)
  oder TCP/IP-Software und l{uft nur auf IBM-kompatiblen PCs. Im
  ersten Fall kann das TFPCR (DL1MEN) verwendet werden, im zweiten
  Fall hilft der Packet Driver AX25DRV f~r BayCom-kompatible Modems
  von Pawel Jalocha.

A rough translation:

  The TFPCX is not intended to be used with TNCs in KISS-mode (eg. PK232)
  nor with TCP/IP-software and it runs only on PCs that are IBM-compatible.
  In the first case the TFPCR by DL1MEN can be used, and in the second case
  the AX25DRV by Pawel Jalocha should be of help.

If I have understood right, the problem with TFPCX is that it emulates
a TNC in HOST-mode and NOS requires KISS-mode.

Hope this was useful.

73 de Tomi

PS. Sorry if there is errors or my translation isn't very accurate.
    Neither German nor English is my mother tongue.

PS/2. I don't know if there is a English translation of the whole doc-file.
      And I'm NOT going to make one with these skills... :)

1989 version of the AEA PK232 TNC $180.00

This an assembled Heathkit. I built it and used it with a
shortwave radio only. I am not a HAM.

Sends and recieves Morse, Baudot, and ASCII RTTY, black and
white facsimile (WEFAX), AMTOR/SITOR, AX.25 packet radio.
Eprom upgradable to latest AEA configurations. (MBX)

Includes: AEA PCPAKRATT & PKFAX software
                assembly, user, and technical manuals
                computer - TNC - printer cable
                (2) radio interface cables
                12 volt 1 amp power supply

I would prefer to sell this TNC to an Orange County Calif.
HAM in a face to face deal. Leave message here or call my
machine at (714) 530-2500. Would consider trade for .28 VGA.

A new version of the TPK terminal software for f6fbb BBS should be released
in a few days. This version will include multilanguage capabilities
and an english documentation.
I 'll put the version on an ftp site as soon as i'll get it.

I am cross referencing two threads here.....
There is one thread in r.r.a.packet about the poor performance of the
present packet network... I don't know who made the first comment...
>
> |> > The ham radio packet bbs network is really nothing more than a toy. It
> |> > is far too limited as far as restrictions on content, bandwidth, and
>   ^^^^^^^^^^^^^^^^^^^^^^^^
> |> > reliability to be used in a production BBS environment of the type that
> |> > land-line-based BBS users have been accustomed to seeing for more than
> |> > a decade.
>
> And there's very important point which you chose to ignore:
> RESTRICTION ON CONTENT. Don't you think it counts?

Yes! It counts a lot, because it is precisly the content restrictions which
keep us from carrying the data which a high speed network thrives on.
We need content rules which will permit NetNews to be carried "live" on ham
radio.

The answer is NOW before us!

Please refer to article <pschleck.714803051@cwis>. It is the text of a Notice
of Proposed Rule Making: "Ammendment to Part 97 of the Commission's Rules to
Relax the Restrictions on the Scope of Permissible Communications in the
^^^^^!
Amateur Service.

The proposed rule modifies 97.113(a)(2) to read: [no amateur station shall
transmit:] Communications in which the station licensee or control operator
have a pecuniary interest...

This will make it possible for my station to transmit "business" traffic
provided I do not profit from it. It is a necessary step which must be
applauded and supported.

The problem is that the rule changes in other areas do not go far enough...

We can transmit notification of ham gear for sale or trade "provided that such
activity is not conducted on a regular basis". This would prohibit a
rec.radio.amateur.forsale newsgroup -- since newsgroups operate on a "regular
basis." Other .forsale groups would seem to be legal provided all traffic was
third party -- no ham can post his own stuff. (The language also seems to
prohibit a regular "swap net" on 2 meter phone.)

The prohibition against transmitting music is still unclarified. The direct
problem of music in space shuttle re-broadcasts was considered and rejected,
however, the FCC did suggest that "Interested parties ... may comment regarding
whether transmissions of music should be allowed." I firmly believe that the
wording should permit incedental transmission of music. The point here would
be that the trasmission of audible music in real time is not the direct intent
of the station. If I get music on hold during a phone patch or am working near
a marching band in a parade I should not be required to shut down
communications. On the other hand, I should not be sticking the mic up to

the speaker on my stereo so that a ham buddy can hear the latest record. Digitized music, computer programs which produce music, or images of sheet music should by no means be forbidden.

Another sticky point is the proscription against "obscene, indecent, or profane language." Does the phone company have a similar restriction on their microwave radios? If so, do they monitor every long distance call to ensure compliance? I agree that radio operators should not initiate obscene traffic, and I would prefer that alt.sex not appear on the amateur bands. Unfortunatly, the rule requires that every bit of traffic forwarded through an automatic station be filtered for possible profane language! This is an impossible task for the operator of a news link. The rule should contain language to the effect that operators of stations in automatic forwarding operation should make a "reasonable effort" to block transmission of such morally objectionable traffic.

May I suggest that everyone interested in a high speed packet network get out their word processors and start letting Uncle Charlie know what we need?

Complete instructions on how to make comments are included in Paul Schleck's origial article (in rec.radio.amateur.packet or by ftp from /pub/ham-radio on ftp.cs.buffalo.edu) or in the September QST.

Comments must be filed by October 1, 1992.

The ARRL says it's legal in "The FCC Rulebook" in the Emissions chapter
in the RTTY subsection. Piccolo is not multiple carrier, but a
multifrequency FSK system with only one frequency at a time.

Clover seems to be mutating. The first description was of a variable
baud rate PSK, but Clover II seems to be something else.

Concerning my previous post, I have it working now. As I mentioned, I had
used various values for both C and R. However, I wasn't able to use the
suggested 2200 Ohm resistor since I didn't have any. I bought some today.

To make a long story short, the key to getting this to work is to use
0.1uF capacitance and 2200 ohm resistance. When making the connections,
make them as short as possible (mine are 1/8" long leads now). Once I
did this, the 727 worked fine.

A side note: the 727 uses a 12V battery pack (12.5 actually). The
Yaesu charger/DC supply does not supply enough current to drive the 727
at full power. I am using a 13.8V DC (auto "12" volt) supply to run the
TNC and the 727. I tweaked the output voltage to 13.25 (from 13.8) and
it can supply the 727 with as much current as it needs. This was an
important fact when using the HT -- if it doesn't have enough juice to
transmit, the packet's beginning will be lost.

Thanks to all who responded!
-Brent

I have an Uncle in Nicosia, Cyprus who is an operator and has been
since the 1930's. I keep in contact with him mostly via fax, but since
I am on the net so much, I was curious if there is a way to use the
resources of the Internet (e-mail, etc) to send and receive messages from
him and other members of the radio club in Nicosia.

I am not an operator myself, so I need any information provided in
a non-technical format please.

Any and all replies and follow-ups are appreciated.

Thanks !!

I am looking for the src code to NOS... I looked on ucsd.edu, and it
appears that there are several versions of this. I'm looking for
a version I can port to my Unix machine... (not sure if that's been
done yet or not).

Could someone tell me which version to get?

Thank you.

I thought Brian would have posted a complete answer to this by now,
but I'll chime in with what I know...

In article <rvcn1q.al@netcom.com> al@netcom.com (Al) writes:
>I notice that UCSD.EDU is advertising the IP addresses of 11417 amateurs
>in the ampr.org domain. Does anyone know if these sites are REALLY
>reachable via the internet? mirrorshades.ucsd.edu claims to be a gateway,
>but it doesn't seem to be.

I don't know what Al means by "advertising", but ucsd.edu acts as the
nameserver for the ampr.org domain. Because of the unique nature of
Net 44, finding an Internet address for one of these nodes doesn't
guarantee that you can actually reach it.

But sometimes you can. As a couple of other people have mentioned,
there are some gateways between the Internet and AMPRnet. Then there
are situations like my (now outdated) "mac.n6bis.ampr.org" listing,
which has an ampr.org name but was actually on Net 129. In other
words, it was reachable over the Internet, but not over amateur radio!

Is everyone sufficiently confused yet? :-)

Patty

     Oh Right! Let's see...between me and Fairbanks, that would mean
only about 12 to 16 new sites and their associated equipment...what was
     that about "hams don't have barrels of money to burn"?
How much would you estimate the cost of ONE complete microwave station,

incl. hardware, software and/or node/tcp-ip setup? I've already spent
thousands already just setting up HF/VHF equipment at this QTH for packet
use as a bbs/forwarding station--not to mention what I'm putting into
trying to get 9600 baud use (rigs/modems/tncs) going.

Well, let's see...I forgot I've got two major mountain ranges to cross,
one with a 20,400 mountain to cross...yes, we've used knife-edge on 2m
to get across before...but microwave? Better add 10 or so more sites,
just to make sure...

This is a test uploading of the Radio Society of Great Britains
weekly GB2RS news broadcast. I hope this is of interest to non-uk
readers..I have removed all the local news.. 73 Ted G8LWY @ GB3KP.GBR.EU
ted@tedb.demon.co.uk

Good morning. It's Sunday the 30th of August and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:-

The RSGB and the Diana tapes; an RAE certificate forger has been convicted; and some new RLOs in RSGB Zone C.

An article that appeared in the National Press this week suggested that it was a radio 'ham' who allegedly intercepted a telephone call from Princess Diana. The RSGB can confirm that Mr Cyril Reenan is not, nor has been in the past, a member of the Radio Society of Great Britain. We can also confirm that to the best of our knowledge Mr Reenan is not a licenced amateur. The RSGB has positively reacted to dispel any association between the hobby of amateur radio and the indiscriminate use of scanners.

Some time ago, a suspected forged Radio Amateurs Examination pass slip was passed to the Radiocommunications Agency by the Radio Amateur Licensing Unit. On the 12th of August the case was heard at Cardiff Magistrates Court where the defendant pleaded guilty to Sections one and three of the Forgery and Counterfeiting Act 1981. The defendant was given a conditional discharge of twelve months and was ordered to pay 50 costs.

Now some good news:

Among the RSGB VHF/UHF certificates to be awarded recently were two slighly unusual applications involving QRP operation. The 432MHz Standard was issued to Chris Rolinson, G0MLY, for having confirmed contacts with 20 counties and 4 countries on the 70 centimetre band. Thirteen of the contacts were made using 2.5 watts and the other 7 contacts with 5 watts to a vertically polarised collinear antenna. The other noteworthy achievement was the first RSGB 10GHz distance certificate to be awarded to a novice licensee. This was issued to Sarah Jewell, 2E1AJE, for the contact with G4BRK. This contact between 2E1AJE's home in Ipswich and G4BRK's portable location on the White Horse Hill was over a distance of 203 kilometres, using of course the Novice power of 3 watts. Full information on all RSGB VHF, UHF and Microwave awards may be obtained by sending a stamped, self-addressed envelope to RSGB VHF Awards Manager Ian Cornes, G4OUT, QTHR.

The Derbyshire 50 and 70MHz beacons, GB3BUX, are now operational with effect from the 21st of August. The frequencies are 50.000MHz and 70.000MHz respectively and for propagation evaluation purposes they share the same keying cycle. Further information on these beacons can be obtained from Tony Whitaker, G3RKL.

Now news of RSGB Liaison Officers for Zone C.

A new RLO for Kent is Fred Stewart, G0CSF, whose address is 'Shingles', Ingleborough Lane, St Mary's Platt, Sevenoaks, Kent, TN15 8JU. His telephone number is 0732 780721. Next a change of RLO for Essex, the contact person is now Malcolm Salmon, G3XVV, 54 Church Road, Rivenhall, Witham, Essex, CM8 3PH.

His telephone number is 0376 514377. With immediate effect, Bill Higgins, G3PNR, 65 Hayden Court, Eleanor Road, Norwich, NR1 2RG will be resuming his duties as RLO for Norfolk and Suffolk.

Attention all RSGB HF Contest Trophy winners. Would all trophy winners please return their trophies to RSGB HQ as soon as possible so that they can be presented to this year's winners at the RSGB HF Convention.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. This week, our DX news concerns Poland: The Polish Contest club SP6PAZ will sign 3Z25PAZ to celebrate its 25th anniversary, during September until the end of December. And to celebrate the 35th anniversary of the Polish Amateur Union, PZK, SP6TPM will sign SP0TPM from the 1st of September to 31st of December.

Rally news now and we know of four events for today Sunday the 30th.

There is the Coleraine and District Amateur Radio Group, Radio Rally and Bring and Buy which is being held at The Golf Links Hotel, Portrush, County Antrim. The event opens at 12 noon and food and refreshments are available. Talk-in is on channel S22.

The Galashiels and District Amateur Radio Society Open Day which is being held at Focus Centre, Livingstone Place, Galashiels. Doors open at 11.00am. There are the usual activities, a bring and buy stall, trade stands and club stalls, etc. Refreshments are available.

The Torbay Amateur Radio Society Mobile Rally which is being held at the Northern Telecom Social Club, Brixham Road, Paignton, Devon. Starts at 10.00am. There is a bring and buy stall, refreshments are available, and ample car parking space.

The White Rose Amateur Radio Society Open Day is being held at the Moortown Rugby Union Football Club, Moss Valley, Kings Lane, Leeds, to celebrate the Club's Silver Jubilee. Activities begin at 12.00 noon featuring special event station GB0WRR, a barbecue and something for all the family.

There is one event for Bank Holiday Monday the 31st of August, this is the Huntington Amateur Radio Society Annual Rally and Junk Sale which is to be held at the Medway Centre, Coneygeare Road, Huntington. Doors open at 10.00am. There will be trade stands, a bring and buy stall, components stands and junk sale. Refreshment will be available. Talk-in will be on channel S22 and via GB3OV. Further details can be obtained from G7DIU by telephoning 0480 431333.

We know of a further four event scheduled for next Sunday the 6th of September:

The Bristol Radio Rally which is to be held at the Brunel's Great Train Shed, Bristol Old Station, Temple Mead. Doors open at 10.30am. There will be the usual trade stands, a bring and buy stall, club stands, and ATV and Packet Radio demonstrations. Refreshments will be available and talk-in will be on channel S22. Further details from G4WUB on 0275 839855.

The Milton Keynes and District Amateur Radio Society Car Boot Rally will be

held at Cranfield Airfield (South Side), Cranfield, Bedfordshire. Take either junction 13 or 14 off the M1 motorway. Talk-in will be on channel S22 using the callsign G8MKC. Further details can be obtained from G1LRU, by telephoning 0908 660798.

The Preston Amateur Radio Society Mobile Rally will be held at the University of Lancaster. Doors open at 11.00am, 10.30am for disabled visitors.There will be trade stands, club and repeater group stands and a bring and buy stall. Free parking available on campus. Further details can be obtained from G Eamshaw, by telephoning 0772 718175.

The Vange Amateur Radio Society Rally which is to be held at the Laindon Cummunity Centre, Laindon High Road/Aston Road, Laindon, Basildon, Essex. The Centre is short walk from Laindon BR Station on the Fenchurch-Shoeburyness line. Approach roads will be signposted. Doors open at 10.30am. There will be trade stands, a bring and buy stall and refreshments. Talk-in will be on channel S22. Further details can be obtained from G4NVT, by telephoning 0268 543025.

Contest news now:

The RSGB SSB Field Day takes place over next weekend the 5th and 6th of September. The rules can be found in June's RadCom. Also over the same period the JARL AA SSB contest takes place. Monday the 7th sees the start of the RSGB QRS Cumulative contests. Further details can be found in July's RadCom.

On the VHF/UHF bands, the next scheduled RSGB event is the 144MHz Trophy and SWL Contest for Saturday and Sunday the 5th and 6th of September. The rules can be found in April's RadCom.

Next news of special events stations this week:

On Monday the 31st of August the Meirion and Dolgellau Amateur Radio Society are using the club call GC4LZP/P in support of the Multi Charities Gala being held at Tal-Y-Bont, Barmouth. The station will be operational on HF, VHF and UHF and also TV and Packet as a demonstration of Amateur Radio Activities. Further information can be obtained from GW3GKZ, by telephoning 0341 422447

On Saturday the 5th of September, the Central Lancs Amateur Radio Club will operate the Special Event call signs GB92APG from the Fulwood Barracks, Preston, Lancs. The event is a Military Tatoo and Beating of the Retreat by the Navy, Army and Airforce within the Barracks. This Military Open Day is being held in conjunction with the Preston Guild-92 and is open to the public. Further information can be obtained from G0LRE, by telephoning 0257 274243.

Some satellite news now:

Anyone who uses the satellite OSCAR-10 may like to know that AMSAT-UK are offering the technical manual free of charge to anyone sending them an A5 or larger Self-Addressed Stamped Envelope. The address is AMSAT-UK, London, E12 5EQ. Please do not phone for this offer.

And now the solar factual data:

This week, for the period 17th to the 23rd August, solar activity was low up to the 20th then a number of M flares caused a severe magnetic storm. Four M flares, the largest being up to an M4.0/1B, were reported on the 20th and three more M flares occurred on the 21st. These caused a collapse of HF band conditions and an aurora was reported during the night of the 23rd. Sun spot counts declined from 134 on the 17th down to only 34 by the 23rd giving a mean of 84 for the period. Solar flux levels also declined from 141 down to 111 units giving an average of 131 units. The geomagnetic activity rose from very quiet on the 17th up to storm levels with an Ap index of 59 units, giving an average of 22.2 units for the period. The state was nil up to the 19th then a magnetic storm started and a proton alert was issued, followed by the flare activity. The radio quality indices declined from well above normal on all circuits on the 17th down to very low levels by the 23rd on all circuit with east/west paths being extremely poor. The aa indices, as supplied by the British Geological Survey for the period 11th to 17th August, were mainly quiet giving a daily average of 18.3 nanoTeslas.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough as reported by Appleton averaged 7.3MHz, but varied from 9.0MHz on the 19th, down to only 4.5MHz on the 23rd. The darkness hour lows averaged 3.3MHz but varied from 4.4MHz on the 17th down to 1.6MHz by the 23rd due to the magnetic storm and flare activity, there was also a lot of absorption, blanketing E, spread F, and other phenomena, lasting up to 8 hours some days which has taken a heavy toll on the HF bands.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 6.2MHz and the darkness hour lows 3.3MHz.

And lastly the solar forecast:

This week, the more active side of the sun will be looking our way. Solar flux levels are expected to be about the 130s, and the geomagnetic activity is expected to be just unsettled. Ionospheric MUFs during daylight are expected to reach 24MHz and the darkness hour lows 14MHz. North/south paths should be best most times, but some east/west paths could open on 14MHz around midnight. Bartells rotation 2173 starts tomorrow the 31st.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S I and G7 N O series, and Novice calls in the 2 0 A D and 2 1 B A series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

> THEIRCALL via MYCALL?

There is an easy way to give them full access. Find yourself a
cheap AT and configure it to run KA9Q NOS, specifically the WG7J
or PA0GRI varients. They are available on ucsd.edu.

Attach your TNC, in KISS mode, to the AT and attach the AT to the
Unix box via a slip line. You can set up the user permissions in
the /ftpusers file on the AT so that only the users you specify
can get on. Your users then just telnet from the unix box to the
AT, login with their callsign and, if you use the wg7j or pa0gri
versions, connect out via the radio using their own callsign.

As an added bonus users on the radio side can also get to your
Unix box.

We're planning to do this locally with a 386bsd box via ethernet,
a novell file server (running novell TCP/IP and NFS) and
G8BPQ/AA4RE. The NOS box will be the radio handler and allow
connections to these services as well as cross band connections.
(We have multiple ports on the BBS now.)

Carl.

I have just become involved with packet radio, using a TAPR TNC 2. My question is, what is the latest software revision available for this TNC (mine is dated 1986) and where could I obtain it?
Thanks.

>with a PacComm HandiPacket and the HP 95LX.
>
>   Doug (VE7FGU)

    I use the HP95 with a PacComm HandiPacket and a
Kenwood HT 27A. It is a very compact setup. Beware
an error in the Buck Rogers article - the receive and
transmit data pins are crossed (2->3 & 3->2, not
2->2 & 3->3 as shown there). The main point he makes
is correct: you need to tie pins 7 & 8 together on
the HandiPacket because of the lack of hardware
handshaking on the 95. Once that is done, works fine.

Although I've been involved in packet on VHF for a number of years, I still go
for long periods that I don't use it and have to relearn protocol. With the
addition of ROSE networks, etc, things have gotten more complex. Is there a
good general book around that covers, on a how to basis, the various commands
and procedures for use on packet, AMTOR, etc? I realize that there are various
documents available if you can get to the right BBS but when you're stuck
trying to just get out it's frustrating. Nacogdoches, Texas tends to have only
a very few nodes on .01 that I can hit.

Appreciate any suggestions.

I've been told that only a minor mod in baud rate is necessary to use an MFJ
1270 TNC on HF. Is that true? If so what's required?

It appears that my recently acquired Kenwood TS-440 has accessory plugs which
would facilitate linking it with a TNC for RTTY, AMTOR, Packet, etc. Anybody
have experience with this? What's involved?

Our Cluster here works very well. We are much more interested in using
it than advancing the state of the art. We won't make changes unless
they are needed or improve things drastically. Our attitude is:
If it Ain't broke don't fix it!

I have been off the air since all the good things have been happening in
packet like S&F mailboxes, TCP/IP, and other things like that. I have a
Heathkit TNC if that tells you how out of date I am with things.

Is there a document you can send me that will tell me about what has been
happening? I am a computer programmer (op. sys internals) so they can (and
hopefully are) be technically oriented.

P.S.: I thought packet was supposed to be error free; when I send or receive
messages to/from the states, even the headers have errors: parts lost and
parts repeated. I've received a message four times even though my friend sent
it once.

Thanks
Scott Nelson, OE3ZNS (WA6BLF in the states)

>third party -- no ham can post his own stuff. (The language also seems to
>prohibit a regular "swap net" on 2 meter phone.)

If individual stations are given responsibility for messages (and relaying
stations alleviated of responsibility) then rec.radio.amateur.forsale would
be OK; individual stations would be prohibited from using "cron" to post
regular forsale announcements, but no one forwarding messages regularly
would violate anything.

>The prohibition against transmitting music is still unclarified. The direct
>problem of music in space shuttle re-broadcasts was considered and rejected,
>however, the FCC did suggest that "Interested parties...may comment regarding
>whether transmissions of music should be allowed." I firmly believe that the
>wording should permit incedental transmission of music.

I do to, but I have a suspicion that the FCC is concerned that they'll see
dozens of pirate broadcasters take root in the ham bands. "Oh, well, I was
just pretending to be a DJ in my ham shack, and the mike accidently got stuck
open while I was playing records! Yeah, that's the ticket! It was incidental
to my spending 3 solid weeks tuning up a really fussy antenna!"

>Another sticky point is the proscription against "obscene, indecent, or
>profane language." Does the phone company have a similar restriction on their

>microwave radios?

The Phone Company is a "common carrier" and is absolved of all responsibility
for what they carry. Apparently the current FCC Chairman FIRMLY BELIEVES that
the Government has a definite interest in clean language, so relaxation of that
rule seems unlikely.

Hi All.
How many of the TCPIP Cordinators in Europe, experiance problems
with the TCPIP network, reported to them by users.
I would like to hear from users of tcpip that have problems with sysops
of digi's netroms flexnet and non tcpip users in general.

The situation here in Germany is rapidly falling appart, more and more TCPIP
users being Bud listed from Netroms routes being messed up in Flexnet systems
and the USE of DAMA digi's to block all pid's other than PID=Text

One local sysop said "TCPIP is like BBS S.F its not permitted"

Well ? You got problems. ? Lets talk about it. and not just on our Butts,
and get Bullyed off the networks.

  Come on now, you are in a very unusual position. Here in east Texas,
it's unusual for adjacent sites to be very far apart. In effect, you
are telling me there are no sites between Dallas and Houston. Alaska
has different problems.
  Perhaps you will be stuck with 1200 baud for a while. The routes
that carry high traffic from many sites will be the first to convert.
That probably means both coasts, especially California and the NorthEast.
  Over *most* of the country, I don't see a need for 400 mile links.

> How much would you estimate the cost of ONE complete microwave station,

The RF hardware is actually quite cheap.   New 10 GHz gunn diode
transceivers run about $40 new. Used units sell from $5 to $20.
True, the varactor tuned ones for really high bandwidth/high speed
systems will run you $70, the difference in cost is probably insignifcant
compared to going from digital hardware that handles 9600 pbs to one
that handles 25 megabits per second. The N6GN hardware is limited by
the slow poke digital stuff. But, I haven't been paying close attention
to what the digital folks are doing, so maybe I should be working on
an optimized varactor setup that will handle 50 to 100 Mbps. Its just
that I haven't seen a digital box to plug this into...

>just to make sure...

Yes, knife edge stuff also works on microwaves. However, rain is a real problem in the 10 GHz cumulatives. It was so bad in August that many people stayed home. I was able to work one station operating from home using 150 ft of feedline (talk about lossy transmission lines!), but most of the people who didn't go out were off the air. Fortunately, three of my friends braved the lousy weather and gave me easy 70 to 133 km contacts though the rain. I must admit that you would probably have to use 4 foot dishes to get booming signals we got (probably at least 60 dB out of the noise on one 100 km path) (2 MHz vs 3 kHz). But, with digital hardware, do you really need such great signal to noise ratios?

Without trees in the way (wonder if they are such a problem in Alaska), signals are always better on 10 GHz than they are on 2 meters (probably because we run just a few watts--and not high power amplifiers on 2M). Of course, this assumes I have the 2 foot dish aimed correctly on one end with the feedhorn approximately pointed on the other.

[Note to Zack: quote less.]

The only commercial products I'm aware of that run at reasonable speeds
for reasonable prices use Gunn-diodes doing direct FSK on 23 Ghz. They
are microwave Ethernet transceivers.

Bdale and crew were working on doing something similar - the goal is to
have a box that you can plug into a PC(or mac, or sun)'s Ethernet hole,
and point its antenna at a similar box, yielding a highspeed link.

I think they got up to about 3mbit a year or more ago. Dunno where it's
gone since then.

However, RCE and his crew have shown that this kind of performance is
probably ONLY available on point-to-point links unless you use some
sort of spread spectrum scheme that can deal with multipath, since in
any non-PtP application with high-speed data, the multipath just chews
the life out of your bitstream. Even 56kb at 433 MHz dies from that.

Note that a repeater system can be equivalent to a PtP link, since each
participating station points his directional antenna at the repeater.

I am trying to get into packet radio. The best way ($$ being a BIG factor) seems to be to build the BayCom modem and use the KA9Q software and the AX25 packet driver for the BayCom modem.

I got the postscript file (wicked cool!) of the schematic for same, but, cannot locate a TCM3105 chip. Does anyone know where I can get one?

Someone mentioned "the BayCom or DigiCom kits". I was not aware that there was a "BayCom kit". Perhaps this would be ideal. (Comments? Pointers?)

I thought about PMP (Poor Man's Packet) and even got the software, but when I tried contacting Andy Payne (of PMP fame) about the availability of their kit, I never got any reply.

To ALL SYSOPS:
Please forward to any HF STA stations you might be aware of.
Thanks!

On August 26th, Dave Sumner (K1ZZ), ARRL Executive Vice President mailed a letter to each HF unattended automatic STA participant. This letter explained the recent ARRL Executive Committee action deferring consideration until November 14th of the draft petition for rulemaking concerning automatically controlled data operation on HF frequencies. Included was a ballot for selecting five candidates from the "STA community".

These five people, which the STA community as a whole will select, will represent us at a meeting with the ARRL Digital Committee targeted for September 26th. It is essential that these five individuals be logical and non-emotional in their presentation of our data - they must be our "sales people" and must convince the Digital Committee to alter their current proposal.

A "working group" on Internet has been focusing on the issues and strategy for many weeks and has been kicking around names of some potential HF STA reps. Our concern is that those chosen to represent us must form a well balanced negotiating team comprised of individuals with complementary and specific skills. If selection is made randomly of people whose names just "come to mind" we will not get the well-balanced negotiating team we need!

No one is telling you, as a STA-participant how to vote. We want you to know who is available - and what their specialties are. So that you may have a better idea of who potential candidates are, a list for your consideration has been prepared. Feel free to add to, delete from or disregard this list!

Candidates:
Hank Oredson, W0RLI (OR)
Author of W0RLI BBS software. One of the original "visionaries". Spent most of the STA period on 14.098 Net and now back on 14.109 Net.

Tom Clark, W3IWI (MD)
Extremely active in AMSAT. Also one of the original "visionaries"! On TAPR Board of Directors. Active on 14.109 Net and others.

David Speltz, KB1PJ (NH)
Very active on both AMTOR and packet providing long-haul links to Europe. CEO of major Boston hospital and "seasoned" negotiator.

John Lind, KD7XG (CA)
Represented STA-participants at ARRL National Convention and was key in getting further discussions set-up. Good negotiator (Calm but determined!) Active on 14.109 Net.

Lyle Johnson, WA7GXD (AZ)
"Mr. TAPR" to many. One of the origianl packet pioneers. Presented his own proposal at ARRL National Convention which seemed to represent common ground for ARRL and us. Past officer in TAPR and the "brains" behind many TAPR kits!

Carl Estey, WA0CQG (MN)
Is conducting a survey of STA participants. This research will be presented at Digital Committee/STA Reps meeting. Active on both 14.109 and 10.147 Nets.

Mike Baugh, W8AKF (Was IN, now CA)
Net manager for 3.610; 7.097; 10.147 and 14.098 Nets. Very operations orientated.

A few further notes: The ARRL will pay travel costs for the meeting. It is likely that travel will occur on Friday afternoon/evening; meetings all day Saturday; several hours of meetings on Sunday followed by return home. Several "candidates" have cautioned of potential time-schedule conflicts so we strongly want the ARRL Digital Committee to consider October 3rd as an alternate date - which works better for many!

All STA participants are encouraged to also indicate on the ballot if they will participate in a transitional STA when the current STA expires on January 13, 1993.

|> nameserver for the ampr.org domain. Because of the unique nature of
|> Net 44, finding an Internet address for one of these nodes doesn't
|> guarantee that you can actually reach it.

Actually, you now can reach many nodes. mirrorshades.ucsd.edu is now pointed to as the router where net 44 touches the regular (hah!) Internet. Besides name service, Brian has got the regional network provider to put net 44 in its routing updates ("advertising"). Packets from the Internet with a 44.xx.yy.zz destination wind their way to mirrorshades. *IF* the site is reachable from the set of gateways, then it'll get forwarded. Not all net 44 addresses are reachable. Better to ask around your local amateur tpc/ip community to find out where your site stands.

...
|> Is everyone sufficiently confused yet? :-)

Nah. Let's try some harder. 8-)

Cheers,
 Willis n5szf

Well, ARRL bashers: Still think Dave Sumner runs the League?

This is a perfect example of how the ultimate decisions are made by elected
Directors, and how the membership can (and does) make itself heard.

> and it is permitted *anywhere* on the amateur bands.

The original post indicated that you could move a lot of data through a
"CQ DX your 59, 73" type of contact bandwidth. I merely pointed out that
such a contact would have to take place in CW, since voice would not
be permitted in the same bandwidth as the digital equivalent.

After all, if you intend to occupy the same piece of spectrum with a

new-fangled digital signal instead of an older mode "useless" type
QSO, your digital signal better be legal in that spectrum. I don't
think the original poster realised this.

Read carefully, Gary. Carefully.

> Then there's
> SSTV, it's not voice, but is allowed in the voice bands. In fact
> it's only allowed in the voice bands. SSTV is an interesting case

> frequency and amplitude shifted carrier.

SSTV is not a digital signal at all, but an analog one. It is not
transmitting digital information, but analog information. If the input
information happens to conform to discrete levels, that does not make
it digital information.

Hence, the place SSTV has earned in our bands, amoung the "analog"
subband.

I'm not sure what is going on in Colorado either. Perhaps new-parenthood has stolen a few extra cycles (:>). (Bdale, you still there?)

In any case, even the stuff I built with radar gun/motion detector sources would receive full 10 Mbps and generally transmit something that bore a resemblance to data up to about 8 Mbps or so. I didn't work very hard trying to improve the tx bandwidth of the modulator since we ended up not using Ethernet cards and didn't necessarily want to spend the system C/N (or DX) on it anyway. As Zack pointed out, at the time we were limited by digital h/w capability and not by the RF stuff. Things really haven't changed much in that respect. While MaComm or similar sources with wider bandwidth electronic tuning can be used to run with Ethernet cards I haven't been particularly interested in pursuing that since it doesn't seem to be a great help in the general problem of building a better amateur network with amateur resources. It attracts the XWindows_at_home crowd and a few other CS types but doesn't do much toward getting the amateur community as a whole involved in working together in a coordinated way in order to create a moderate or high speed wide area *network*. It's chief value is in higher speed backbones and it's all we can do to support the current ~250kbps development going on at the moment (on hamradio budgets) without trying to give *users* 10 Mbps or faster service. Getting them to work together to install well located local hubs and connect their clusters together with backbones is presently challenge enough at these speeds.

As I've said before, the microwave link article was intended as a teaser as much as anything else. I wanted to demonstrate that higher rate information transfer was not expensive if you got into territory where you could effectively communicate the associated energy. To answer a question of an early poster in this string, parts cost was on the order of $100-$150 per end for the 2 Mbps 10 GHz link.

> However, RCE and his crew have shown that this kind of performance is probably ONLY available on point-to-point links unless you use some sort of spread spectrum scheme that can deal with multipath, since in any non-PtP application with high-speed data, the multipath just chews the life out of your bitstream. Even 56kb at 433 MHz dies from that.
>
> Note that a repeater system can be equivalent to a PtP link, since each participating station points his directional antenna at the repeater.

I think this is what Brian meant but I'd modify by the above to use the phrase Line-of-Sight (LOS) rather than PTP to avoid confusion and emphasize that this is a physical layer issue. Even Ethernet has this problem. At the physical layer it is *not* broadcast. There is a shield on the coax. This is crucial to its success. It's also interesting to me that Ethernet's DX which is often thought of as being limited by the CD requirement and the packet length/transmission delay issues is on the verge of being limited by multipath and losses. I

haven't done an exhaustive analysis but when the effects of cable losses are combined with reasonable estimates of reflections due to mismatches (at the taps and terminations) it looks to me like inter-symbol interference would kill things even if the minimum packet length were increased to keep the CD function alive. As I remember from my estimates, the present maximum Ethernet DX is about halfway to this limit.

For amateur radio, adding spreading is not a panacea either. From an economics and resources viewpoint, the additional loss incurred once one deviates from LOS is so bad that even if multipath weren't an issue, I don't believe that hams would be able to afford the systems that would be necessary to get highspeed data through; even in the microwave bands where we have the best (only) shot at it. We don't mind an extra 30 dB loss most of the time when we're jawing on our 10 watt 2M nbfm radio via the local repeater and have 60 dB to spare but when that is applied to a higher information rate system running with much smaller margins it's a killer.

We developed the Hubmaster protocol, which has a lot of similarity to the user/repeater model Brian mentions, as *a* means to implement an intermediate solution given ham resources and population densities. It doesn't solve the problem for the sparse user situation. Even with the best LOS/microwave solution it's going to co$t to pipe information over DX. Some of the really long haul situations (coast to coast, continent to continent) may be served by satellites operating in a controlled point-to-multipoint manner but many local backbones between clusters of users (not to mention the cluster itself) are going to have to funded by the local users. This is a model similar to the local nbfm repeater club with the extension that it is a linked repeater system. The good news here is that hams probably have the best line on access to the primo local sites and know the local powers-that-be (if they aren't them themselves). For once we have an asset/resource toward building a physically distributed wireless network that even the big guys have trouble financing.

The Hubmaster protocol is a compromise in the direction of full pt-pt LOS paths which are probably not currently practical given the amateur radio environment. It allows a multiplexed server (a polling protocol and radio with an antenna which is designed to serve multiple users in the azimuthal plane while having gain in the elevation plane) while letting users pick up some of the advantages of directional antennas in order to make system requirements and spectral reuse reasonable at higher data rates.

When the day comes that an amateur network has to have 100 Mbps (or 1 Gbps) to the user to be "interesting" and "competetive" then we'll all have to have pt-pt protocols and narrow beamwidth (millimeter wavelength?) antennas or else *real* LOS/point-point hardware ... optical fiber to our doors.

In the meantime we're trying to find an affordable and interesting intermediate speed solution using amateur radio. I'm trying to get things ready to put the first of the 256 kbps radios with an MIO

digital interface/control on top of a local hilltop this coming weekend.
Wish me luck.

   I agree with comments about packet radio being slow and
backward, but the messages I send on it often get through,
in weeks if not days. On the land-line nets I find an awful
lot of what I send comes back because the route has disappeared.

gerry@bluemoon.rn whose home bbs has trouble getting the
mail out sometimes, so it may go here instead.

Having just picked up a Mac PB-100 laptop, and knowing full well that
a HT isn't the ideal radio for doing packet, I'm now wondering -- can
I do anything with my Yaesu 2-meter HT and the new laptop?

I have a camping site within reach of a packeteer's repeater system,
and an inverter to provide power from my car battery ... now what?

Thanks for the advice, from this novice. N6VSB.

With these few cycles it gets hard to demodulate such a transmission unless

you know something about it. For example, one could use one of many
self-clocking techniques. How about maybe XOR-ing the intended data with a
repeating pseudo-random sequence everybody agrees upon, maybe, say at twice
the bit rate? Sounds a lot like DS spread spectrum...

New version of ax25 driver to link NOS and a BAYCOM-like modem
is uploaded to ucsd.edu. I believe I fixed the problem with some
UART chips handling differently IIR register. I decreased as well
transmitter buffer size from 8K to 4K (is it still too much ?)
so the driver occupies 10K of RAM instead of 14K.
The assembler source is included with the package.

Importaant note: if the driver does not work on your PC
boot it with minimal config.sys/autoexec.bat
and give the driver another try. SP9AUV here noticed
that the driver would not work unless he removed from autoexec.bat
a pretty simple program saying "Dzien Dobry" (that is "Good Morning"
in english). The reason is not understood and this program seems not
to be resident.

Pawel, SP9VRC

Piccolo is multitone OOK and Clover IS a form of PSK, it is QAM.
According to the last propaganda I saw, they had 16 point square
constellations in the highest speed mode. This means it is not
JUST PSK, but also has an amplitude component. I view this as
highly suspect without some pretty fancy adaptive equalization
going on because of the rapidly changing channel. Suppose you go
through a 10 dB fade (not at all unusual on any HF channel), how will
you distinguish between a high amplitude point and a low amplitude point?
It is for this reason that I have chosen to limit my work to 600 to 1200 bps
and use only constant amplitude signals on each of the carriers that make
up the (now decidely nonconstant amplitude) composite. I do not know if this
work will ever come to fruition since I cannot form a working relationship
with AEA and this is just too time consuming and frankly valuable to do
for nothing.

Greetings all...

There was a message on the local PBBS's that one of the groups in our area
(Phoenix, AZ) is going to shut down all their BBS's, nodes, etc. over
the Labor Day weekend to protest the ARRL position on unattended
forwarding. They seem to think this will "send a strong message to the

ARRL".

Seems kinda stupid to me. Seems like they will be only proving that the
world can get along just fine without packet forwarding, which I would
think is exactly the opposite of what they want to show.

Is this a widespread protest this weekend or just an isolated group?

I see two problems with this. First since many hams will be out enjoying
the week end any way, doubt they would miss the network for a weekend
and second the ARRL is in Newington I doubt that a Phoenix shutdown
is going to bother them.. How about a simple letter writting drive
to let them know first hand, not just a huff and puff session.

I have a packet station consisting of the following equipment:

Rig : Alinco ALM203E H/H
TNC : BSX2 (TNC 200 clone)
PC : AMSTRAD PPC640DD

I think I have a problem with the above which I think might be
stemming from the H/H I use. It`s a relativery old H/H but has given
me good and reliable service, however I have noticed that it`s use
seems to result in the loss of quite a few packets on my local frequency.

By this I mean that the TNC DCD light is illuminated but the CON light does
not flash to indicate that the packet has been rx`ed properly. It also seems
to be very susceptable to the frequencies of the tones, as I have two nodes
wroughly equidistance from me but their tones are very slightly different,
rsulting in one being rx`ed ok the other only very occasionally.

I have used a FT290R in same setup in place of the ALINCO which has fixed the
problem.

My main question then is, I guess the problem may be due to two things - the
squelch
open time of the RIG and also the de-emphasis, Is this correct?, Has anyone else
had
this problem with the rig or can suggest any mods?? Would fitting a H/W DCD to the
TNC
and running with open squelch help, can it be done on my TNC, has anyone got any
details
of a mod or design for a DCD.

I hope you can help cos this problem is very fustrating...

     Princeton's BITFTP gateway still exists but it's been closed to everyone except the people actually on BITNET, i.e. the people who are *supposed* to be using it. It was shut down because of dimwits who tried to d/l GNU EMACS or the X windows source distribution through email and blew out intermediate sites' mail spools one too many times.

     There's another such gateway at decwrl which was still operating as of a few months ago. Send me email if you're interested and I'll dig up the address you poke to make decwrl emit its help message.

That, of course, is the problem with any amplitude modulated signal. The trick, as always, is to arrange for the symbol times to be different from the characteristic fading times of the channel. If the symbol time is dramatically longer or shorter than the characteristic fading time, then distinguishing

real symbols from channel conditions is possible. The QAM encoding at the bps rates assumed by Clover should make the symbols longer than rapid fades in the channel and shorter than the long fades that also sometimes occur. With it's method of dynamically varying symbol times depending on channel conditions, and assuming decent AGC in the receivers, Clover II should have the capability to perform near the peak of channel capacity under widely varying channel conditions. And naturally, if you have more than 10 db of fade margin in the channel, say 2 S units, then 10 db fades are only a slight nuisance.

I shouldn't be telling you how to suck eggs, you're the expert here, but I'd think that the kinds of post processing used on weak space signals should also work with Clover or any other modem modulation scheme. Various moving window enhancement techniques are available to draw the signal out of the noise or fill in holes in a fixed duration symbol. Beyond that, various FEC methods can retrieve damaged bits. Perhaps we need to broaden our focus from just modulation methods to complete systems for moving error free data.

The most dramatic example of the power of post processing that I've seen is in D2 digital video. A picture that looks like a snowstorm in raw form becomes crystal clear after deconvolution and post processing using 2D Reed-Solomon FEC codes and bit interpolation. The inner block coding retrieves byte errors and the outer block coding can recover 2 kbit burst errors. Interpolation can handle any doubly damaged bit strings. The kinds of errors produced by mechanically moved magnetic tape are remarkably similar to the kinds of errors expected on an HF channel with it's noise bursts and fades. Tape dropouts and mechanical mistracking map nearly one for one to lightning crashes and channel fades when viewed in respect to the symbol time of the data.

...hm, I've been on packet for nine years, now. Seen it change.

To tell the truth, I'd view a shutdown of this kind as a positive
event.

When all is said, if I need timely, content insensitive data
communications, I'll use the Net, dialup or real PSNs.

Packet, as is, is an interesting pastime, but nothing to get upset
over......

....I know, blasphemy, but such is my viewpoint.

Now, when we change to a nice uniform 9600, with defined channelization,
frequency agile tnc/txcvrs and all that good stuff....

                        Lee

>If you
>want to claim that TV is inherently an analog medium, I beg to differ.

Hey, here's a way to pick that nit: TV is analog in the horizontal
dimension, digital in the vertical dimension.

>
>I hope you can help cos this problem is very fustrating...

Tone twist, the phone company term for the effects of incorrect
pre-emphasis/de-emphasis, is an annoying problem that plagues many
packeteers using the microphone input and speaker output of their
voice radio for packet. There are a couple of solutions. The best
is to go into your rig and insert tones directly at the modulator
stage and extract tones directly from the discriminator stage,
bypassing the bad emphasis networks in the radio.

The second solution doesn't require modifying the radio. Simply
put RC networks in the input and output leads that compensate for
the poor emphasis networks in the radio. You'll need a test set
of some sort to know when you have the total curve just right. Or,
you can just play it by ear on a separate rig until everything
"sounds" right. That's usually close enough.

Hardware DCD and open squelch is almost always a good idea. TAPR
has a kit that plugs in the modem chip socket to implement this.
It's cheap and simple to install.

I would like to enter the world of amateur radio.
I have an Icom 2SRA and an IBM, I would like to purchase a TNC that would
be able to do VHF/ and HF, plus (not only Packet) but other things such
as RTTY or Fax.

Does anyone have any suggestions?

Thanks. Guy N5URI

I have an older Radio Shack 1000 which is more or less IBM
compatible...Radio Shack does not seem to have accessories
to set it up as packet radio...they do sell one short wave
transceiver (10 meter only) for about $250......I heard
from someone recently that I should be able to get
going with packet for a total of less than $300....So
I need a TNC or a used PK232?
Is there any mail order that sells this stuff used or
perhaps a newsgroup.
thanks. oh yes I have a novice license.

The reasons for many actions were to:
1. Show unified support against the ARRL proposal.
2. Offer support to those with legitimate views.
3. Thank those STA stations who have been handling our mail.

To this end, it may have been successful. Having already had our
community in contact with and having had assurances that our Director
was acting on our behalf and then coming to find he was, instead,
abandoning us, I find it difficult to fully believe that this latest
action will be fruitful. I hope, I just don't want to get burned
again.

73,
Steve, NO8M

Subject: rsgb gb2rs news 6th september
Distribution: world
Organization: 5/10
Lines: 215
Date: Sat, 5 Sep 1992 04:29:00 +0000
Message-ID: <715667340snx@tedb.demon.co.uk>
Sender: usenet@gate.demon.co.uk

Good morning. It's Sunday the 6th of September and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

And we start this week with news of two new beacons which are undergoing tests
this month:

It is proposed to make test transmissions this month of the RSGB's Propagation Service Beacon which has the callsign GAM1. Tests will commence on Tuesday the 8th of September, between 09.00 and 10.00 and between 19.00 and 20.00 local time. The frequency is 3.8123MHz which is just above the UK 80 metre amateur allocation. The purpose of the test is to ascertain the service catchment area and the quality of signal. Listeners are requested to send reports containing: Date and Time, Location, Signal Strength and Signal Purity. Reports to be sent to Gwyn Williams, G4FKH, whose address is correct in the RSGB Call Book. Should any listeners require more information, a Self-Addressed Stamped Envelope would be appreciated. Further details of this new service from the RSGB can be found in the June 1991 {newsreaders - this is 91, not 92} edition of Radio Communication.

Another new beacon, this time on the 430MHz band, has become operational. GB3BSL is currently running 50 watts ERP from Dundry which is 8km south-west of Bristol, locator IO81QJ. Reports would be appreciated by the Gwent UHF Group whose beacon keeper is Frank Evans, GW8AWM, whose address is correct in the RSGB Call Book.

News now of a change of address for Bob Harrison, G4UJS, who is the RSGB Trophies Manager, and Shropshire's EMC Coordinator. His new address is Green Lane House, Whixall, Shropshire, SY13 2PT.

The 1992 Conference of the World Association of Christian Radio Amateurs and Listeners will take place from Friday the 9th to Sunday the 11th of October, at Hoddesdon, Herts. Further details can be obtained from G4EZU, by telephoning 0474 533686.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Canada, VE3XN is signing VA3200M until Monday the 14th of September to mark the bi-centennial of Sir Alexander Mackenzie's crossing of North America by land. From Angola, EA7El is signing D2EL until the 15th of September. Operation is SSB on all bands from 80 through to 10 metres including the WARC bands. From St Pierre and Miquelon, K1RH will use the callsign FP/K1RH from now until the 15th of September, mostly on the WARC bands.

Rally news now and we know of four events for today Sunday the 6th.

The Bristol Radio Rally is being held at Brunel's Great Train Shed at Bristol Old Station, Temple Mead. Doors open at 10.30am. There will be the usual trade stands, a bring and buy stall, club stands, and ATV and packet radio demonstrations. Refreshments will be available and talk-in will be on channel S22.

The Milton Keynes and District Amateur Radio Society Car Boot Rally is being held today at Cranfield Airfield (South Side), Cranfield, Bedfordshire. To find it, take either junction 13 or 14 off the M1 motorway. Talk-in will be on channel S22 using the callsign G8MKC.

The Preston Amateur Radio Society Mobile Rally is being held at the University of Lancaster. Doors open at 11.00am, 10.30am for disabled visitors.There are

trade stands, club and repeater group stands and a bring and buy stall. Free parking is available on campus.

The Vange Amateur Radio Society Rally is being held at the Laindon Community Centre, Laindon High Road/Aston Road, Laindon, Basildon, Essex. The Centre is short walk from Laindon BR Station on the Fenchurch-Shoeburyness line. Approach roads will be signposted and doors open at 10.30am. There will be trade stands, a bring and buy stall and refreshments. Talk-in will be on channel S22.

There are three events for next Saturday the 12th of September.

The Ballymena Amateur Radio Rally is to be held at the Ballee High School. Doors open at 12.00 noon.There will be the usual trade stands; an RSGB bookstall; QSL bureau; a bring and buy stand and refreshments. Further details can be obtained from GI4HCN, by telephoning 0266 659769.

The RSGB Scottish National Amateur Radio Clubs Convention will be held at the Fife Institute of Physical and Recreational Education, Viewfield Industrial Estate, Glenrothes, Fife. Doors open at 11.00am, 10.30 early entry. Further details can be obtained from GM4ALA, by telephoning 0506 410677 day time or 0592 742763 evenings/weekend.

The Wight Wireless Rally which is to be held at the National Wireless Museum, Arreton Manor, Newport, Isle of Wight. Doors open at 11.00am. Further details from G3KPO, by telephoning 0983 67665.

And there are four further events for Sunday the 13th.

The British Amateur Radio Teledata Group Rally is to be held at the Sandown Park Exhibition Centre, Esher, Surrey.The location is well signposted and is some 10 minutes from junction 10 of the M25. Doors open at 10.30am. The event features over 250 tables, including top companies, special interest groups and a bring and buy. Refreshments will be available and there is a large parking area. Talk-in channels are S22 and SU22. Further details from G8VXY on 021 453 2676.

The Lincoln Short Wave Club Hamfest will be held at the Lincolnshire Showground and Exhibition Centre, which is 4 miles north of Lincoln on the A15 road to Scunthorpe. Doors will open at 10.30am. There will be all the usual trade stands and large bring and buy stall. Refreshments will be available and talk-in will be on channel S22. Further details can be obtained from Sue Middleton, by telephoning 0522 531788.

The Madley Satellite Earth Station Amateur Radio Group Radio Car Boot Rally is to be held at the Sports Ground in the Satellite Earth Station Complex, located 7 miles south west of Hereford. Gates open at 09.30am. There will be all the normal attractions, including a bring and buy stand. There is ample room for free parking and picnicking, including a special parking area for disabled visitors. Talk-in will be on channel S22 via G7BTI. Further details can be obtained from G4ASR, by telephoning 087 387679.

The Telford Amateur Radio Rally will be held at the Telford Exhibition Centre,

Telford, Shropshire. Doors open at 10.30am. There will be trade stands, club and special interest groups stands and a bring and sell stall. There will be some very large free car parks and talk-in will be on channel S22 and via GB3TF on channel RB8. Further details can be obtained from G7BWQ, by telephoning 0952 770922.

Contest news now:

Tomorrow, Monday the 7th, sees the start of the RSGB QRS Cumulative contests. These events feature slow Morse and further details can be found in July's RadCom. During next weekend the European SSB DX Contest takes place. See August's RadCom for details.

Now news of special event stations:

The Silverthorn Radio Club will be operating GB0VHM from the Exhibition of Wireless Through the Ages at the Vestry House Museum, Walthamstow, North East London, during Saturday the 12th. Operation will be on the 80, 40, 15 and 10 metre Bands, and on 2 metres and 70 centimetres. Further details can be obtained from G0LWS, by telephoning 081 529 4489 evenings only.

The RAFARS will be operating the special event callsign GB0RAF on the HF bands and on 2 metres on Saturday the 12th and during the Lincoln Hamfest on Sunday the 13th.

The Scarborough Special Events Group will be on the air during Saturday the 12th and Sunday the 13th, using the Special callsign GB40NY to celebrate the 40th anniversary of the North York Moors National Park. Operation will be on the 80, 40 and 2 metre bands and 70 centimetre band. A full colour souvenir QSL card will be issued to commemorate the occasion. Further details can be obtained from Roy Clayton, G4SSH, whose address and telephone is correct in the current RSGB Call Book

The Phoenix Amateur Radio and Novices Society will be running a stall at the Telford Rally on Sunday the 13th. They will operate the Callsign GB0NOV.

Celebrations of the Centenary of Southend's Town Charter on the 19th of September will include a procession featuring the Lord Mayor of London. Southend and District Amateur Radio Society will run two HF stations and one on 2 metres using GB100SBC. The club would like contacts with anyone with a connection with the town and with other towns called Southend. Further information from Brian Wood, G4RDS, on 0702 232322. On Sunday the 13th of September.

North London Raynet will be operating GB2RAY from the 999 Emergency Services Exhibition in Victoria Park, London, E9. Visitors to the station will be most welcome.

And now the solar factual data:

This week due to the holiday we are short of some data, but for the period 24th to the 27th August, with the quiet side of the sun looking our way, solar

activity dropped to very low levels. There were no M or X flares reported. The sunspot counts have declined considerably and were only 35 on the 25th, with the mean count for the period being only 44. The solar flux levels have also declined to below what was expected, and averaged only 96 units, with little change day to day. The geomagnetic activity has been unsettled most of the time with the Ap indices averaging 12 units for the period. The state has been nil, nothing to report, throughout the period. The radio quality indices recovered somewhat from the very low levels of last week, but have still not reached normal levels. The aa indices, as supplied by the British Geological Survey for the period 18th to 24th August, were at very unsettled levels, with the daily average for the week being at 38 nanoTeslas. However during the aurora on the night of the 23rd, levels increased to 171 nanoTeslas which is equal to a level of K7. The overall picture of cycle 22 in month 71 is that now it is declining very rapidly. A small increase in activity may occur in the September to October time frame but after that we expect a decline to the minimum which is due in mid 1996.

Now the ionospheric data for England and Wales:

The F2 daytime critical frequencies at Slough, as reported by Appleton, averaged 7.2MHz with peak times now being about 19 to 20.00 hours. The darkness hour lows averaged 2.7MHz, with the minimum times being around 04.00 hours. There has been some spread F most days and a little other phenomenon.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Irkutsk averaged 6.2MHz and the darkness hour lows 2.8MHz. A solar data beacon is now operating with CW on 10.142MHz using the call DK0WCY, it issues solar data appertaining to the previous day together with a forecast every 5 minutes.

And lastly the solar forecast:

This week, the active side of the sun will be rotating away and solar flux levels are expected to be about the 120s. Geomagnetic activity is expected to be just unsettled. Ionospheric MUFs are expected to reach 24MHz during daylight, and 18MHz in the darkness hours. North/south paths will be best, but 14 or 10MHz could give east/west paths near midnight.

And that is the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S J and G7 N P series, and Novice calls in the 2 0 A Delta and 2 1 B B series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Subject: TCPIP in Germany Users BANNED
Date: 5 Sep 1992 23:12:15 -0700
Organization: UCSD Usenet Gateway
Lines: 41
Sender: daemon@ucsd.edu (The Devil Himself)
Message-ID: <9209060547.AA13946@ucsd.edu>
NNTP-Posting-Host: ucsd.edu

Hello all again.
Seems the problems inGermany with TCPIP users is again getting worse
Users are being banned locked out and generaly abused in Germany. I have
again for the N.th thime this past weeks been Banned my self, Hi Hi
I operate in the Rhein Mainz area, the worst for Black listing TCPIP
operators. It really has not stopped me operating at all, i simply
re-routed the IP via another host on the same Digi.
I have Emailed My tcpip co-ordinator about this problem in the past and
again recently, His responce in the past has been Im going to do nothing
and in the present He seems to prefer the If i ignore the problem it might
vanish. Not realy good enought is it.
In the past year i have had mails with very offensive nature with all sorts of
threats. well there are some Hams like this in Germany Unfortunatly,
In the north of Germany TCPIP operation is very much suppressed and its
spreading south.
Thanks to you that replied to my Request for info about simular action against
TCPIP users in Europe, I revieved many such cases of Users bein Banned Locked
out of Netroms and digis, However None of the TCPIP users that i know who have
been sent abusive mail and have been Locked out of digi's would actualy admit
to haveing a problem. I know that most users have been intimated to the extent
of actualy being removed of their License. I was told by one sysop that this
is what he would do, to me.. as if he has this power . Hi Hi.
Ok. I am asking any of the Leagal Buffs out there, What do you sujest ?
If this problem existed in the USA what action would you take ?

For the local readers of this Group in Germany the path to DC0HK.ampr.org
is now routed via DB0ODW [be it the sysop has locked me out] I have arp route
via 44.130.24.100 or arp route via 44.130.24.78 and arp route via 44.130.42.3
this is enough to keep All links going at normal through-put ;-))

Digis that have sysops that lockout users:
DB0ODW DB0ZDF DB0SPC-8 DB0MAV [can some update the list from the north please]
there are now many more these are just a few as Bad examples.

So again WHAT ARE >you< going to do about this type of action here in Germany

TCPIP is not going to Vanish over night, and the Bad sysop policys are going

to increase, unless >You< stand up and do something about it. and not just

Hi,
I am living in Denmark in Europe, and as I may loose internet access
some time in the future I would be intyerested in ham radio conection.
How do you get started ? Where is the traffic going on ? How do I get in
contact with routers, gets Internet address ? ....

is there a FAQ ?

Is there a file I can download to tell me the meanings of the text
inside the < >'s below (I think I'm asking for a downloadable reference
for the AX.25 protocol. Maybe inside a program's doc file??):

```
    AUR1>N0MXS [via LOV*]  <RR (P) R0>
    N0MXS>AUR1 [via LOV*]  <RR (F) R5>
    AUR1>N0MXS [via LOV*]  <I (Text) R0 S5>:
    AUR1>N0MXS [via LOV*]  <RR R1>
    AUR1>N0MXS [via LOV*]  <DISC (P)>
    N0MXS>AUR1 [via LOV*]  <UA (F)>
    N0MXS>AUR1 [via LOV*]  <I (Text) R7 S0>:
    AUR1>N0MXS [via LOV*]  <DISC (P)>
    N0MXS>AUR1 [via LOV*]  <UA (F)>
    WA5VRL-1>ID  <UI (Text)>:
    N0MXS>AUR1 [via LOV*]  <REJ R1>
```

(I'm new to packet and am having fun with Poor Man's Packet (which of course did not come with a TNC manual!)

Please email file names (and with anonymous ftp internet address with directory path is best!).

Thanks!

In-Reply-To: <Bt5FH5.FAy@news.cso.uiuc.edu>

I buil 2 of the A&A baycom kits and also have the new Tigertronics Baypac-2. I use them on the macintosh with the KISS TNC software I am writing. I can't comment on the IBMPC software as I haven't ever seen

it running.

The A&A is a kit which is fun (for me anyway).
 It comes with a compleat schematic.
Stas at A&A is very helpfull with any questions.
It doesn't come with a case. I picked one of the modems up while it was in
 use and it emitted a squeal and stopped working.
One of the 12volt power supplies stopped working.
The power connector is the oposite polarity of most 12v equipment.
There is a red LED for xmit and a yellow one for carrier detect.
Carrier detect is not brought out to the connector (the 7910 modem
 chip doesn't really have a good carrier detect for radio work anyway)
The A&A modem does support 300 baud HF

The Tigertronics modem is line powered so no need for an external power supply.
It comes assembled (ick).
It is has a case, it is built into a DB25 connector.
It does not come with any sort of schematic. I had to trace some pcboard foils
 to figure out how to hook it to a macintosh. It does come with a
wireing diagram
 for ibmpc's with both the DB25 and DB9 wireing.
Since it is line powered it may not work without a seperate power supply on
 IBMPCs that use non standard line drivers with low power charge pumps,
 for example the hp95.
It has one surface mount tinie tiny LED that seems to be carrier detect.
I don't know if the Tigertronics supports 300baud HF
Talk to John Olson for tech support.

I heard that Paccom in tampa florida has modem built into a DB25 similar to
the Tigertronics, but I have never seen one.

Although I don't get any money for ham work I did accept discount from A&A
and a modem from Tigertronics to use in writing macintosh software. Hopefully
I have been fair in the descriptions.

Packet does not retransmit the signals of other stations.
Sorry, you are wrong. In the purest sense, Packet forwarding stations
are not repeaters. In a broad sense they are. However, in the above
97.3 definition, the meaning here is in real time much like a 2m voice
repeater. What comes in, goes out in close to real time (some voice
repeaters have digital delays). Also, the packet digipeater is not
retransmitting "the signals" of another station. What its doing is
recording the data in the other stations signal and putting that
data in a "signal" of its own and transmitting it. Careful inspections
of AX.25 readily show this. In fact, if you just think about it a little bit
you can understand that a packet digipeater strips stuff of the incomming
data and adds stuff to the outgoing data. Before you jump on my case
(I don't know if you will or not), let me invite you to and if you
do answer these questions when you respond:

If a packet stations receives 10 AX.25 packets on day, holds them for
a total of 10 seconds and send out the data again, is it a repeater?

What if it holds it for 5 minutes?
                        1 day?
                        1 week?
              1 year?

The fact remains that "retransmitting a signal" is not what a digipeater
does. It retransmits the data in different form. Therefore, digipeaters
are not repeaters. Besides, how many repeaters do you know that can
do receive and transmit operations on the same frequency? One of the main
components of a repeater is OFFSET. Digipeaters have no offset. Repeaters do.

>>NO. 10M FM are REPEATERS. Only REPEATERS have any differences and then only
>>in what *I* consider VHF segments. Above 29 Mhz.
>
>1. Check the definition above. Repeater does not exclude digital.

No it does not exclude digital. However, in my technical opinion, most
digipeaters are not repeaters. Notice I said "most". If you want
a digital repeater, you can take a voice repeater and dedicate it to
digital. In that case, you have a digital repeater that falls under the
same definitions and regulations as a voice repeater.

>some precedents to be set just to be sure.)

Al Gore, yes *that* Al Gore, is pushing a bill to commercialize the networks we are now using for free. When we start receiving a monthly bill based on bits/buck, using the landline networks is going to look a lot less attractive. I just want people to keep their options open. If we lock ourselves into the landlines for long haul packet, we may regret it later.

>Sure, just be sure that you see technical "payback potential". HF at 300
>baud with robots shows how to fill up spectrum all day long, but that's
>actually unhelpful. If we could do reliable 9600 kb HF data with exotic
>modems, meteor bounce, or what have you, I'd like that!

We can. But as long as 300 baud systems handle the load, no one is going to invest in more exotic systems. If we have a permanent place to use the technology, rather than an expiring STA, I think usage will increase to the point the system will collapse from overload. I *hope* the system collapses from overload. That's the only way we're going to get people to spend the money to make a better network. We've seen it at VHF. People were satisfied with simplex digipeaters and 1200 baud until the number of users increased and the systems collapsed. Only then did duplex repeaters, trunk connected MANs, and 9600 baud modems become popular around here.

If it ain't broke, nobody is going to pay to fix it. We've got to load the systems until they break to force higher capacity. Therefore spectrum filling 300 baud HF robots *are* helpful to the cause of high performance networking on the amateur bands.

Nope. I'm afraid that OOK takes the top prize! (On / Off Keying)

> PSK methods available today can push 9600 baud over good HF channels.

There's a couple of problems using PSK over normal HF channels. First of
all, most crystal filters in HF radios have really gross phase characteristics.
This causes some signal degradation with FSK, but more with PSK.

Second, (and most important) is that multipathing of HF signals introduces
tremendeous phase distortion. The only way to combat this problem is to
lower the symbol rate so that the distortions don't last longer than the
symbols. (Which is also why 45 baud RTTY and even 100 baud AMTOR work
on 80m, but 300 baud packet does not)

Another way to combat the multipath distortion problem is to always operate
near the MUF, which results in clean, single path signals. Tom Clark had
some success running 1200 baud PSK on 10m, for example.

> But the rules prevent it.

Not really. The rules dictate a maximum symbol rate (300 baud below 28 MHz)
and a maximum shift (1000 Hz below 30 MHz). Other than that, the rules are
remarkably open.

Of course, you'd have a hard time stuffing 9600 bps data down a channel
with the characteristics of most HF radios....

Why not w. a DSP modem? Someone just has to code it up.
And, oh yeah, get the FCC to OK it on HF.

>The 2400 baud chip set has been out there for quite a while so it isn't
>like it's brand new technology. Interesting question here, is ham radio
>technology driven at all?

What protocol is used for 2400 BPS packet? Is it the same as 2400 baud
protocol aimed at telephones? Or is it different, like 1200 baud
packet?

I think the situation right now is that 1200 is still reasonable for
local (no hopes, or up to about 2 digi's) interactive communication.
So, as long as the SYSOPS are running 9600 for message-passing, there
really isn't a need to mass produce high-speed modems for everyone.

However, I predict once DSP modems enter the market in force, there
will be a large switchover to higher baud rates. It just doesn't seem
to wise to buy a 2400 baud modem today, when this fall or next
spring you could buy a DSP modem and do everything.

As soon as W3EAX, University of MD club, buys a DSP modem, I'll let
y'all know how good it works. (Should be some time this fall).

I guess it is a question on bandwith. How much bandwidth does one need
to say do 4800 baud on HF? How does that compare with SSB voice?
(not including spread-spectrum, that's cheating :) although it should be
looked into. What are the rules for S.S. on HF right now? Are there
commercial S.S. kits?)

VHF packet runs at 1200 baud which is quite slow. Access over the phone to

a BBS can be as much as 32kbps with compression. Since the audio bandwidth
available on a phone line is much the same as on a 2 metre FM channel, can
similar techniques be used with packet?

I appreciate that certain countries' rules may not allow this, so let's keep
the discussion technical. I suppose cost may be a big factor, but is it at
least feasible and therefore worth pursuing?

I own an Apple //c, and have just started looking into VHF packet radio.
Does anyone know of a TNC to connect to a Realistic HTX-202 and the Apple
//c? Also, what about packet programs?

  I've heard "realtime" chats across the packet network between southern
Houston and NW Arkansas. It's slow, but usable. You need to go through
quite a few sites! :-)
  While we're on this topic: does anyone know of a packet path that reaches
from Texas (*anywhere* in Texas) to Arkansas, without using any HF gates?
I have mapped much of that region (NE Texas) from *both* sides, hitting the
Arkansas side via HF gate, and I still haven't found a VHF crossover.

All this frustration of long distance stuff, rules and other info got me thinking. Are there any rules about how fast someone can send CW? I doubt it. WHat if computers were sending CW (I think the rules specify morse, which is fine), how fast can they listen? On 80 meters a cycle takes about 2.7e-7 seconds, if you could get computers to deal with 3-5 cycles as a dit, and 9-15 cycles as a dah, you could really push some bits trough. Assuming you had a really good error correction code, there could easily be reliable communications. If the computers paid attention to error rates, the speed could vary depending on noise, and other stuff.

Or we could plead with the ARRL to change the rules (Sorry, couldn't resist, I thought the ARRL ran the FCC).

Some of us are already paying for Internet service. And the people
we get it from (PSI) don't allow us carry third-party traffic. (And
you thought hams were the only ones with third-party traffic
restrictions!) If/when the government gets out of the business
of subsidizing the Internet, you can expect that sort of thing to be
the rule rather than the exception. I agree with Gary: go ahead and
make use of the Internet, but don't let's stop trying to build our
own, independent network.

Slow is good sometimes. AMTOR goes nearly as fast as I can type, and
about twice the speed I can think on-line.

Not so my friend. Whilst there is a one to one correspondence of

available characters between BAUDOT(Murray) and AMTOR(plus the
extra housekeeping bytes), the encodings are quite different.
AMTOR uses seven bit characters. Each valid AMTOR character
has a 4/3 ratio of mark to space (or visa-versa, I don't recall off hand).
This is used to determine if an error has been received. Many SITOR
decoders and some older AMTOR decoders output
BAUDOT, so it can be printed on a regular teletype (tm reg).

The only problem is making them hear each other. The faster you send, the
wider your signal is. 9600 baud PSK is about as wide as an FM voice channel
(not quite, but close enough), and going faster would just be worse. One
possibility would be to use tone encoding so that each baud represented several
bits. If you could handle 4 tones instead of 2, you could fit twice as much
~~~~~~~~~~~~~~~~

data in the same period of time. I don't know how much more bandwidth that would require, however.

     Theoretically speaking (or asking), assuming I was in the Gigacycles, what method of modulation would be best for sending 10mbit/sec data?   "Best" can fall into different catagories. Best BER, use of BW, S/N ratio... or whatever you can think of.
  Let's also assume the coding is the same as used over IEEE 802.3 wire. I'll also assume full or half duplex is irrelevant at this time.
Please e-mail to me below.   I'll post if there is anything useful. Thanks.

REAL DCD'ers don't have floppy DCD's. With that introduction, the TAPR DCD, and those I have done for the DSP stuff are data coherence detectors.

This means that they occasionally false on `unsquelched noise' but are much more robust than simple noise detectors. At random, the filtered output of your demodulators, before clock recovery and data extraction, will look like valid data for long enough for a real DCD to false, that is to inform you (light up a DCD LED) that it has detected data when there is none present. Given this, it is by far the best way to do this job. These envelope detectors, and energy in band detectors are easily fooled by people cranking up the volume or AGC bringing up the inband noise to the point where detection is declared.

Bob

Sean, N3LQN, asked about merits of PK232 vs 1278. I got a number of replies about my comments on the MFJ software, some agreeing with me but many others saying they had no problems. Since the comments were mixed, I still feel I wish I had paid a few bucks extra an bought the AEA TNC.
  Sean, the 1278 hardware seems fine, but I am not real thrilled with the software, either MFJCOM or Multicom. I have been able to work around some of the problems, but not all. For packet only, LANLINK works well with the 1278. But I want to retain the FAX andSSTV features. On the other hand, most of the software problems I have are evident in the packet mode, and the system works pretty well with FAX and SSTV. Its just that I envy the people in my area that bought the AEA, as they just plug it in, run the software, and it works.
  One of the maddening things to me about the MFJ software is that if there is compatibility with a file, for example, viewing an image data file that is in wrong format than specified by menu selection, the system has a tendency to go over the hill, locking up, and needing a reboot. I wish they would have put in a more gentle way of telling me I had selected something wrong!

No, on/off keying is fairly spectrally efficient, better than FSK. With
weak signals and poor decoders, it's error rate can be higher though.

>> PSK methods available today can push 9600 bps over good HF channels.
>
>There's a couple of problems using PSK over normal HF channels. First of
>all, most crystal filters in HF radios have really gross phase characteristics.
>This causes some signal degradation with FSK, but more with PSK.

Well if you insist on using Japanese voice radios, you shouldn't expect
good performance. Military radios with mechanical filters don't seem to
have a problem.

>Second, (and most important) is that multipathing of HF signals introduces
>tremendeous phase distortion. The only way to combat this problem is to
>lower the symbol rate so that the distortions don't last longer than the
>symbols. (Which is also why 45 baud RTTY and even 100 baud AMTOR work
>on 80m, but 300 baud packet does not)
>
>Another way to combat the multipath distortion problem is to always operate
>near the MUF, which results in clean, single path signals. Tom Clark had
>some success running 1200 baud PSK on 10m, for example.

Multipath selective fading can be a serious problem. Operating near the

MUF is the best dodge around this, but diversity reception will also
help a lot. 9600 bps on HF is not going to be a weak signal mode.
Systems like Piccolo and Clover that use multiple carriers to transmit
bits in parallel with long symbol durations are likely a more robust
way to go at HF.

>> But the rules prevent it.
>
>Not really. The rules dictate a maximum symbol rate (300 baud below 28 MHz)
>and a maximum shift (1000 Hz below 30 MHz). Other than that, the rules are
>remarkably open.
>
>Of course, you'd have a hard time stuffing 9600 bps data down a channel
>with the characteristics of most HF radios....

You can encode 9600 bps into 600 baud, but cramming it into 300 baud
is a remarkable achievement even on excellent circuits. With the quality
of typical HF paths, QPSK is about all you could do today. I'd love to
be proven wrong of course.

>Yes, but universities are effectively in the same boat.

No, universities on the Internet are there because the Government has paid
for their connection as a way to improve the value of their Government-
sponsored research; either that, or they've signed a commercial contract with
one of the commercial Internet providers. In either case, they're a line-item
on someone's budget.

>Sure, just be sure that you see technical "payback potential". HF at 300
>baud with robots shows how to fill up spectrum all day long, but that's
>actually unhelpful. If we could do reliable 9600 kb HF data with exotic
>modems, meteor bounce, or what have you, I'd like that!

One *can*. But why would anyone bother with people claiming it's a waste of time when the Internet provides "free" access to gigabit cross-country fibers? Of course, when alt.binaries.pictures.* finally saturates the Internet, causing the government to place a moratorium on non-official traffic on their links, and the commercial Internet providers finally institute per-packet charges that will make the European PTTs green with envy, then it'll be time to start work on HF links, right? If there's anyone left then who cares and knows how, anyway...

Also, "The Internet" is still chiefly a US and Canada phenomenon, and "The Free Internet" definitely is. If you'd like to be able to indulge in high-data-rate communications with a ham in, say, Chile, sponging off the Internet won't do it.

Lanlink makes me ill. I'm really skeptical about any program that will sit there and blather at a TNC for two minutes and not bother to see if anything is there (it just sends in the blind). There really isn't any customization for different TNC types (as long as what you're talking to is enough like a TNC2 you're OK) and the parameter setup is most kindly described as hokey.

On the other hand, PAKET seems much better. It actually interacts with the TNC rather than typing blindly at it, and has a much nicer user interface, on line documentation and help.   You knew you were into something intersting when you see how fancy the install program is. The shareware contribution ask is only half what they ask for in LanLink.

>(not including spread-spectrum, that's cheating :) although it should be
>looked into. What are the rules for S.S. on HF right now? Are there
>commercial S.S. kits?)

4800 bps will easily fit in an SSB voice bandwidth. Systems using multiple
carriers could do it with greater robustness. For an example of the possible,
look at the Telebit Worldblazer technology. That does 38.4 kbps over a voice
grade phone line with the same bandwidth as a legal SSB voice transmission.
It uses DSP with multiple carriers, a training sequence, and half duplex with
fast turnaround. It also will automatically adjust transmission rate for
channel conditions. You can't just attach a Worldblazer to a ricebox and
go at it, but it shows what's technically possible in the field.

SS isn't allowed on HF under current rules. It's only available at 420 MHz
and above. HF STAs have been granted however. HF SS radios are available on
the military market. There aren't any plug and play appliances yet for the
ham market. This equipment has to be purpose built, not just a $100 accessory
to a ricebox like current TNCs.

High speed packet, whether UHF or HF requires special radio hardware.
You don't want to limit yourself to the characteristics of existing
voice radios. It's better if the modem *is* the radio. That's the way
the 56 kb RF modem GRAPES produces works.

The fastest real world computer to computer CW that I've witnessed
was in the 100 WPM range. I've *heard* of attempts at 1000 WPM, don't
know if they were sucessful or not. 100 WPM is 599 characters/minute,
or about 70 bps if the characters had been ASCII encoded instead.
Not very impressive.

I heard that there is a version of the W0RLI BBS that was written
as part of pack-et-term but I have not had any luck in chasing it down.
If someone has this program and can pack it (lharc or zoo, etc) and
the either let me know where to get it or uuencode it and mail it to
me, I would greatly appreciate it.

Thanks

swood

Which bill are you referring to? I understand the NREN will be a
national research and education network paid for by the government.
It might be capable of providing pay services, but the internet
already is (Well, CARL, etc.)

Incidently, I'd wager Al Gore is the only person on a presidential
ticket who even knows that the internet is.

Lines: 20

Well I have been using the MFJ 1278 for TCP/IP (KISS MODE) working
flawlessly for the last year. Well now when I start up kiss mode and
start running msys or ka9q it works for a few seconds, and then
stop working. (Specifically it will not key the transmitter.)
PS-The battery inside the TNC is fine (first thing i checked).

The kicker:

If I use AX.25 mode and run normal packet it works perfectly.
I called MFJ and they said that they want me to ship it to them
for a modification for $60 US. (PS it is out of warranty)

IF you even think that you might have an idea, I would appreciate
any help, suggestions, hints.

Sincerely

Jerry

>10-15 hours since then trying to get it to transmit on my HT.
>A damn modem circuit shouldn't cause this much trouble...

Everything I've ever bought from Ramsey has been garbage including their
counters. I started with the counter kit. I put the thing together and
for the first time before or since, could not make the damn thing work.
They used hinky RC coupling networks between counter stages that appeared
impossible to get working. I sent it back and got an A/T one in return.

They used an uncompensated color burst crystal for the time base that
was as stable as, well, a color TV :-) I yanked that out, installed
a surplus Hewlett-packard ovenized oscillator and have been pretty
happy with the unit. It burns out displays and/or drivers fairly
often because both are being driven beyond ratings.

I bought the two meter amp kit. made a fine power oscillator. It went
back for a refund.

Then I bought the "radar gun". This abomination uses a TVRO FET transistor
running as an oscillator at about 2 ghz as the rf source. Stability? NOT!
The "display" uses an RC oscillator as the "timebase". They couldn't even
manage to put a crystal on the thing. Got it together, all voltages
checked out, the display lit up and flickered several digits around zero.

Clamped the thing in the vice and walked in front of it and.... It worked
for about 6 feet. By "worked" I mean different numbers appeared on
the display than when I was not moving. I don't think I can walk
20 mph but who knows?

IT's really too bad Ramsey is like this. We really need a good kit source
since Heath went tits-up. Unless you enjoy cussing and throwing things,
Ramsey is not the place.

John

ER, UMMM, (cough) As the administrator of a domain in the Internet
I may have some news to help this out.

The NSF net has always been scheduled to become a commercial network.
Federal funding is backing off by design so that the network will be self
supporting after a time.

Our local network ("local" meaning restricted to this state) is a part of
WESTNET. WESTNET charges $5000 per year for an industrial customer with a
56Kbaud feed. As soon as anyone in the state coughs up a $5000 fee, WESTNET will
become officially a commercial network, no longer subject to "research network"
rules for Utah originated traffic.(We are hunting for an angel with $5K now.)
Note that the fee is annual, not traffic based. There are no plans I know of
to do volume billing on Internet. Once you pay the connection fee, that's it.

So internet fees are not a problem, But, as has been pointed out, Wireline
networks is the wrong answer for ham radio for many other reasons.

I want to have the anti-commercial rules changed for amateur radio.
Until "hams" start carrying some volume traffic, there will be no need
for anything better than 300 buad E-Mail. Put NetNews on the air and
watch those 9600 baud and faster modems start showing up... Especially if
I can get my neighborhood rural school to buy the modems so that I can provide
them with a network feed. (Their modem, my license. I can't be paid to run
the radio, but nothing says I have to OWN it, just CONTROL it. Schools have
been buying ham stations for years for the benefit of thier students. This is
just another benefit for the students, having a netnews feed.)

The opportunity for service, as well as emergency communications would be
amazing. (Imagine if Mackay, Idaho, had had a 56K radio link when the
earthquake hit in 84...) Just tie the radio link to the school network and
use every machine in the lab to type or recieve emergency traffic. MAYBE
THE TRAFFIC WILL EVENTUALLY GET AWAY FROM THE OLD BAUDOT TELETYPE LOOK X AT
LEAST WE CAN HOPE SO X I AM ALMOST ASHAMED TO PASS A MESSAGE IN THE OLD NTS
FORMAT X IT LOOKS LIKE A LEFTOVER FROM THE GAY 90S X SINCERLY YOURS

There has to be a perceived need before hams will advance the state of the

art. If the rules prevent the state of the art being advanced, it's time
to change the rules. At 300 baud I can filter all messages for commercial
content (perhaps). At 9600, no way. Packetized voice at 1200 baud is a joke.
at 9600, with speach compression, it's doable. (I have watched pro basketball
on a 168Kbaud circuit and could follow Karl Malone's dunks.)

Now if someone would write a one-to-many feed algorithm for netnews....

It is quite possible to cram more than one bit per Hertz into a channel.
The tradeoff is reliability: you need a higher signal/noise ratio for
a given bit error rate.

My impression is that current TNC modems do a very sub-optimal job of
decoding signals in the presence of noise. I suspect you could increase
the baud rate without increasing the error rate if you designed a better
modem.

>push some bits trough.

I wrote code on an old TRS80 MIII that could easily do 40 WPM send and
receive (and was auto speed to boot).

40 wpm x 5 characters/word = 200 characters/min
200 characters/min x 10 bits/character = 2000 bits/min (incl start/stop)
2000 bits/min / 60 = about 55 baud....

I could probably make my Amiga do 80-100 WPM, which should be 100-150 baud

The limiting factor on trying to send pulses only 2-3 rf cycles long is
going to be the ability of the transmitter to key anywhere near this fast.

tedwards@src.umd.edu (Thomas Grant Edwards) writes:
>I guess it is a question on bandwith. How much bandwidth does one need
>to say do 4800 baud on HF? How does that compare with SSB voice?

If your question is how much bandwidth do you need for 4800 *bits per second*,
a quick answer is that a 3KHz-bandwidth US phone line is good for a little

over 20,000 bits per second with clever encoding schemes [1]; an HF link probably has a poorer S/N than a typical US phone line, so you probably couldn't go quite that high. However, at least when the bands are open and relatively noise-free, you could probably push 9600 bps through an SSB-sized bandwidth. If you really wanted to know about 4800 symbols per second (baud), then you'll have to specify how those symbols are encoded before you can get an answer.

>(not including spread-spectrum, that's cheating :) although it should be
>looked into. What are the rules for S.S. on HF right now?

The rule for HF spread spectrum is, as I recall: no.

[1] One of the hangups (pun unintended) in the current V.FAST modem standardization effort is the resistance of the Europeans to accept the top speed under consideration (24Kbps? I don't have an article handy) as an official standard speed option, because so few phone lines in Europe have adequate S/N to handle it...

>It might be capable of providing pay services, but the internet
>already is (Well, CARL, etc.)

NREN legislation has a lot of baggage attached to it. One of the things it will do is commercialize the regional networks and charge for non-research traffic on the high speed network. The Internet was never intended to be a free network, it just sort of grew that way. Government funding is slowly being withdrawn for other than government sponsored research usage today. With NREN, most of the current usage of the network will become strictly

pay for play. While this is probably as it should be in a capitalist nation, it means our days of freeloading on the government financed network are numbered.

>Incidently, I'd wager Al Gore is the only person on a presidential
>ticket who even knows that the internet is.

I wouldn't be surprised, and even he doesn't seem to have a good grasp of what the network really is and what access to it really means. The free flow of information it provides is extremely valuable for US competitiveness. On that subject, a couple of events have transpired recently that show the government as a whole has little grasp of this fact. NASA Ames was recently raided by security types who feared that free interaction on the net was giving away valuable commercializable information.

They don't seem to understand that research is only valuable if it is communicated widely to an audience that can use it, and that technical discoveries aren't the exclusive province of the US. The information flows both ways. The real edge in competitiveness goes to the people who *act* to commercialize products based on the information, not to those who hoard it tightly away from even other Americans.

The second bit of mischief is insistance by the FBI that advanced digital networks be "dumbed down" so that they can conduct wiretaps on them. There is a bill being introduced to Congress written at the request of the FBI to enforce this. Bit stream interleaving, datagram routing, and the like are to be prohibited if they prevent reliable wiretaps using simple technology. Heaven forbid that users use any form of encryption that hasn't been authorized by the government and not designed so that the government can easily break it.

Right now the FBI is complaining about *call forwarding* on the telephone network. They claim it can be used to circumvent wiretaps. These guys are really in the dark ages, and want to keep us there too.

Is there an FAQ for this newsgroup?
If so, I probably should apologise
for polluting your wave-band with this.

I'm interested in linking 2 computers by radio
rather than over the telephone.
I assume that is what packet radio is for.

On looking into it, it seemed that before one could do this
one had to pass some sort of amateur radio test.
Is that the case everywhere?
I went to a couple of meetings of local radio-hams,
but basically we weren't on the same wavelength.
They spent their time twiddling knobs and soldering.
And they spoke in this sort of techno-esperanto.

Now I'm not prejudiced.
Some of my best friends have soldering irons.
But I don't want to spend my twilight years
listening to white noise from South America.

So my question is, can I not just buy 2 of these radio-modems
and forget about the authorities?
And if I can,
what sort of money are we taking about?
And how far can I shout?

Any hints (or evern FAQ's) gratefully received.

>First, calculate the bandwidth of the proposed modulation scheme.

Ahh, 1Hz?.. I am talking CW (Carier Wave).

Everyone, I was sorta half joking, and half serious. The potential

was realized by some, and others blew it off as silly. As others
point out this network is for the exchange of information. We are
exchanging information, and trying to make people think.

Imagine if you will, the perfect setup. A 2Kw CW 80 meter station in
North Dakota, Fargo maybe. An Identical station in Minneapolis. How
fast could these 2 stations talk to each other under ideal conditions?
If the speed were variable (adaptive; too many errors, slow down),
could they be reliable even under less than ideal conditions.

There was an aritcle many years ago about a Z80 based morse reader
that was good to maybe 80-100WPM. Ok fine, how about upping that to a
68020, or a RISC chip, could that reliable handle 500-1000WPM (more?).
With current DSP chips the S/N ratio could be pretty good before the
morse reader ever saw it. How fast can the xmitter be keyed, that
might be more of a limiting factor. It ain't gonna be cheap, but we
are talking about the inter-city links for the long distance network.

Another alternative that telebit uses are multiple carriers (tones)
allowing for more 'parallel' transmissions. Using DTMF tones would
give you 8 bits at a time. Are there rules about this?

Yes it is sorta unreasonable, think about it.

OK, then why, oh why, does the FCC limit transfer rates on HF?????????
I understand bandwidth limits, but if we can put 9600 bps into the
same bandwidth as "CQ DX...your 59, 73! CQ DX...," then we should!
Is the ARRL pushing for bandwidth-limited data xmission on HF?

Banko) writes:
         (flame deleted)

I got the Ramsey kit to work finally, and the kit design is actually pretty
good, but I still am unhappy with Ramsey for:

    1) their ridiculous price for this kit ($70)... seems like
         $50 would be plenty fair including the case, and
    2) their lack of troubleshooting advice in the manual or
         more considerate help on the phone

The Baycom Lesson

The Ramsey kit allows a simple rewiring to get it to work with the Poor Man's
Packet software on a parallel printer port (TTL levels?), but their kit
only comes with the Baycom software (lucky I have access to the net and was
able to get a hold of the PMP software quickly and easily... what
about those poor hams who don't have the luxury of access to the Internet!)

I traced the problem with the Baycom configuration to an inactive DTR signal line on my RS232 port. (Horowitz & Hill, The Art of Electronics, 2d Edition has some good sections which discuss the RS232 standard, and lots of other neat stuff). I might have blown this line at some point during my experiments (RS232 is supposed to be pretty robust by its standard... +/- 5-12 V @ 500mA and able to withstand a direct short between outputs), *or* the DTR signal might just not be implemented in my Goldstar clone's serial ports. (*BEWARE*, Baycom users of this potential problem. I wonder how common this is? My telephone modem works just fine on this port, and detects rings, etc.)

What was confusing me was that I was seeing a signal at the PTT transistor base which I now realize was a just a false "pull-up" signal from the Mic line which works fine. (My radio just wasn't keying up during transmit, and since transistors are something of a mystery to me, I started imagining all sorts of terrible things about bad component values, etc., not realizing that the signal levels that I *should* have been seeing are pretty obvious... (i.e., "big", +/-12 V on the RS232 side of the CMOS 74HC04, and TTL levels on the output sides of the 74HC04)

Anyway, this is a little constructive followup which I hope will help somebody else.

And thinking about it, the BW isn't going to be 1Hz any more,
either. There are better ways to tackle this.. Ways that actually
exploit the things DSP is good at..

Clover & piccolo work along these lines (getting more bits per baud).

I have both the 1278 and 232, use them for listening only. I dont like the 1278 method of choosing the filters and modems. too confusing.
The 232 seems to decode rtty easier.
I dont like the cartridge software for the 232 using a commodore 64. The stuff is buggy, and the type of printer support is too limited. The printer support on the 1278 is a little less limited, but not much for the c64, still not good enough.
I still have not gotten the 1278 to print successfully using the commodore software, but have with the 232, by buying the only printer supported and it works fine.. there are other bugs in both softwares, I hope you guys with ibmers have better luck.

I have bought two of Ramseys kits, the vox and the super snooper, and have been less than satisfied.
The vox kit doesnt work jwith the microphone they push so hard in the catalog, and the super snooper quite frankly is not that powerful of an amplifier and sounds like shit.
I did get the vox to trip by hooking the super snooper up jto it, the suggestion jof one of their techs(why dont you try this?, he said).
their stuff reminds me of the simple circuits in an Electronics class text book designed to demonstrate a principle,
but have no practical use because the circuits are not sophisticated enough to be useful.

:
: The limiting factor on trying to send pulses only 2-3 rf cycles long is
: going to be the ability of the transmitter to key anywhere near this fast.

The limiting factor is that a string of dits 3 cycles long on 80 meters
is equivalent to AM modulating a signal with a 1 MHz (or there abouts)
square wave and will put out sidebands that won't quit. At best,
you'd end up with a signal 2 MHz or so wide. A bit outside the band edges.

There ain't no such thing as a free lunch.

  I have spent a good bit of time trying to produce a map of the
packet network that I can reach. So far this extends across East Texas,
all of Louisiana, and parts of Arkansas, Kansas, and Oklahoma, and Mexico.
(Yes, Mexico, not New Mexico.) Is anyone out there interested in seeing
this information? I should note that the packet network changes at a rate
that makes the Internet look slow, so there can be no guarantee that it still
matches my information. It changes faster than I can update, and in some
cases the changes block my access to whole segments of the network.
  The information is in a paper notebook, not electronic form, so it
will require some effort to type in and reformat. Don't expect to see
it next week.
  My biggest problem/frustration to date has been my inability to find
a VHF path between NE Texas and SW Arkansas. Actually, the dividing line
is inside Texas. I am forced to go through a very busy HF link in order

to access much of the net. In some cases I can work nodes on both sides
of the "invisible barrier" that are only a few miles apart, but they do not
talk to each other.
  If anyone out there can get from TXK (Texarkana) to LFKN (Lufkin) without
HF links, I would appreciate a quick summary of the path used.

I know that the current DX Clusters use netrom and an agressive VC mode
to get the information to its logged on users.. Has any one thought that
the TCPIP telnet session is far more efficient way of doing the same thing
with out so much QRM on the much used links, Then perhaps the 3.rd world
wars that are currently happening in most parts of Europe between tcpip users
and the DX Cluster users who think that the DXC is the only thing on the
network, may stop.. Thoughts? after all Netrom is dead! is it not..
hi tech tcpip auto-routers are far more efficient..

I am having problems successfully building NOS from several sources off UCSD.EDU -- and can't seem to locate any documentation that gives hints for debugging NOS when the program is very large compared to available memory. Can anyone suggest a document that helps beginning NOS hackers and/or addresses issues related to building NOS in Borland C++ 3.0? I also could use a hint as to what is the most stable version to work from these days. NOS_1229 seemed OK, but has loads of compile errors (at least, the version from UCSD.EDU seems to...) Thanks! I received the following note from Keith Sproul. Please help him put together a really nice collection of Macintosh ham software for inclusion on the next Buckmaster CD. (I believe Buckmaster has a policy of giving a free CD to anyone who contributes a program they've written, so you might want to ask Keith about that.)

The HyperCard stack he refers to is search software for use with the Buckmaster callsign database. If it hasn't been on the CD before, it will be for the next release.

Patty

p.s. "sproul.com" isn't a real Internet site; it gets mail through an MX record. So unless Keith has some other access I don't know about, he can't do FTPs.

p.p.s. I suppose I should say this just to be safe: Apple Computer
has no idea that this project exists, so it obviously doesn't
endorse it.

Attn: Hams with Macintosh computers

Buckmaster Publishing produces a CD-ROM with the call book data and
with lots of IBM ham-related public domain software. They want to get
some Macintosh public domain ham-related software too. I wrote the
HyperCard stack that they are shipping with the CD-ROM. I have also
agreed to collect the Macintosh public domain software for them and
orginize it to go onto the CD-ROM. We have about 100meg of space
available for Mac related software...

I would like to get as much Mac software onto this fall's CD-ROM as we
can. However, we are under some time constraints, and I need to get the
stuff SOON.

If you have any public domain ham-related Macintosh software, PLEASE
send me a copy. If it is small, send it via AppleLink, otherwise,
please send it on a floppy to my address below. I can also be reached
via the Internet.

Lines: 31

According to one explanation of why Nicad batteries die that I've heard,
small metal whiskers grow across the electrodes with use, and eventually
develop a short which prevents the battery from holding a charge or from
being charged.

The solution is to charge the battery as best is as possible, and then
short the battery terminals for a brief (?) time which is supposed to
melt these whiskers (and I suppose the metal flows back to the electrode
of origin).

Has anybody done this? What exactly have you done?
Must it be done on single cells? I am trying to do this on a battery
pack. One pack won't take enough of a charge to warm up the
shorting wire, while another battery pack heated up the shorting wire
so fast I couldn't hold on to it (I guess you should use pliers!).

Is less than a second of shorting enough?

(I'll let you all know if it is after I charge this battery and run
it down again.)

Thanks.

Is the Baycom software source code available anywhere? Since Baycom
won't work on a number of PC clones because the serial port implementations

are variable, it should be possible to modify the source code to adapt
it to some of the more popular clone multi-function cards so that it
can be used.

Thanks for any leads. (Of course I could try to make contact with
with the original authors in Germany, but maybe somebody else has already
done this?)

I tried to pursue the question of source code more than a year ago when
I began to play with BayCom. I wrote to the authors, sent them the
requested donation, and also wrote to the English translators of the
documentation. I never really got a reply, but I think the actions of
the authors and the current semi-commercial state of BayCom indicate
that there is little hope of getting them to release the source.

There are two cheap packet options for which source is available. One is
Poor Man's Packet (PMP) which uses the parallel port. The other is the
AX25 packet driver written by Pawel Jalocha which allows you to use

KA9Q NOS with a BayCom modem. When I first heard of this I thought it
would be nice to be able to do TCP/IP with the BayCom interface; I didn't
realize until I got the NOS software that it supports ordinary AX25
packet operation as well as TCP/IP.

By the way, one kind of serial port incompatibility with BayCom that
can be dealt with easily is that some serial ports don't provide
enough voltage swing on their RS232 lines to supply power to the BayCom
modem. This was the case with my laptop. Arranging to get 7 to 12 volts
from another source for powering the modem takes care of this problem.
Of course, if the serial port incompatibility is at the software level
the problem still remains.

Hi,

I'm interested in converting my mac+ to run off a DC source, i.e., bypass the
power supply inside and run the machine from a 5/12 VDC source. This

way, I could use it as a mobile radio station or for emergency purposes.
(Running it solar/car/battery).

Has anybody done this, or heard of anybody doing this? If so, could you
please email me what you know? I have schematics and other technical
information, but it's good to hear about others' experience too.

Thanks,
-Brent

As stated in the "running a PC off car battery" thread a few weeks ago,
the best and easiest theng to do is get an "inverter" 12VDC to 60HZ AC
(square wave" box. You also get isolation from car engine and alternator
spikes and other crud. Tripp Lite makes this things, and I remember seeing
them in DigiKey. Be aware that you should get an oversized inverter, so
it can handle the computer's power demand when you turn it on.
Usual disclaimer: I have no connection with TrippLite, DigiKey, or the
Chinese Communist Party.

A better way is to charge up a capacitor then discharge it through the
nicad. The heavy current pulse blows away the whiskers. Using a
capacitor allows you to control the amount of energy you apply to the
task. Start with a small cap and go up till it works.

I am interested in exploring the world of ham-radio, and interfacing this
to my computer in order to access the internet and other computer systems.

I'm a 'newbie' and really haven't a clue as to where to start. I need
information regarding equipment and its respective costs, how to locate
a site to 'hook-up to', software to use, licensing, and anything else
involved.

I would be very grateful if someone would help me get started here. Likewise,
if there's a FAQ for this group, I would appreciate getting that sent to
me as well.

Please respond via email... I'm working at getting this group fed in my
news (which will be a little while).

Thanks in advance,

Forrest Aldrich

Yes. And note that Piccolo and Clover are *NOT* PSK.

Don't use PSK, Use something else. Use multiple carriers. Use amplitude
variation. PSK doesn't survive well unless you are close to the MUF.

So far, I've heard good things about PacTor, which lowers the symbol rate

to 200 bps, but improves throughput.

I've also heard good things about Clover, which apparently changes encoding
rates to suit conditions (which is exactly what we need for HF).

> OK, then why, oh why, does the FCC limit transfer rates on HF?????????

The FCC does not limit transfer rates. They limit symbol rates and overall
frequency shift (which can be interpreted as bandwidth).

I think the FCC did well to avoid setting transfer limits. It really
isn't practical to use symbol rates in excess of 300 bps below 20 MHz.
You could argue that 1200 baud transmission be permitted on the 15 and
12 meter band, since it would be useful there.

If you can figure out a way to send more information through a 300 baud,
1 KHz bandwidth channel, then get crackin'. We hams haven't even stratched
the surface of more efficient digital transmissions on HF, and you are
clamouring for higher symbol rates!

> I understand bandwidth limits, but if we can put 9600 bps into the
> same bandwidth as "CQ DX...your 59, 73! CQ DX...," then we should!

Note that the above CQ DX would have to occur in CW. After all, the
digital transmissions don't occur in the voice subbands, they occur
in the digital subbands.

> Is the ARRL pushing for bandwidth-limited data xmission on HF?

Until we make use of the limits we've alread been set, I don' think the ARRL
sees a need for this.

This is a typical nicad death mode. Eventually they just wear out.

> The solution is to charge the battery as best is as possible, and then
> *short* the battery terminals for a brief (?) time which is supposed to
> melt these whiskers (and I suppose the metal flows back to the electrode
> of origin).

Sometimes, a nicad will short out like this prematurely. In this case, it
is sometimes possible to revive the nicad (temporarily) by "zapping" it.

Since a shorted nicad won't hold a charge at all, you supply current from
an outside source. A suitably large capacitor charged to several volts
will do the trick, vaporizing the 'whiskers' in the nicad with an inrush
of several amps.

I've successfully zapped nicads by tapping the individual cells with the
output of a 20amp, 12v power supply. The connection must be brief, lasting
only a fraction of a second. Otherwise, the nicad will heat internally,
and may explode. Use extreme caution. I urge you to use the capacitor
method, since the amount of energy (and the subsequent heating) are limited.

> Has anybody done this? What exactly have you done?
> Must it be done on single cells? I am trying to do this on a battery
> pack. One pack won't take enough of a charge to warm up the

> so fast I couldn't hold on to it (I guess you should use pliers!).

ONLY "ZAP" INDIVIDUAL CELLS! NEVER DO THIS TO AN ENTIRE PACK! You will merely
ruin the remaining good cells in the pack.

And NEVER, NEVER short out a Nicad pack. Ever.

This wasn't meant to be a funny comment. I think that it's unrealistic
to expect commonly used voice rigs to be suitable for high performance
data transmission. We see this same problem at VHF/UHF when people insist
on using voice radios for data communications. Alinco made a half hearted
attempt at a data radio, and Kantronics has done much better with their
D410. You don't expect a voice radio to be a good ATV rig and you shouldn't
expect it to be a good data rig either. Different modes need radios
optimized for different characteristics. Radios that use the Collins
mechanical filter, or it's equivalent, have a pass characteristic more
suited to data use than the current crop of amateur consumer voice
radios. Yet a Collins filter can be had for $30. This isn't so much
a cost issue as a design issue. One size does not fit all. I suggest
that the path we took with the 56 kb RF modem is the direction that
high performance RF data transmission must take. That's to make the
modem the radio. That way it is optimized to the characteristics of
the modulation used.

>>>

>>>Not really. The rules dictate a maximum symbol rate (300 baud below 28 MHz)
>>>and a maximum shift (1000 Hz below 30 MHz). Other than that, the rules are
>>>remarkably open.

Piccolo and Clover are not PSK, but they also aren't a single 300 baud FSK
carrier either and they are illegal under the current rules. Transmission
of multiple carriers in the same band by the same station is forbidden.
The rules weren't designed to handle this case. A simple bandwidth
restriction without other constraints on signaling method would make
more sense. Note that while Clover occupies a bandwidth of about
200 Hz, Piccolo occupies a bandwidth similar to a AM voice transmission.
It's thruput is high of course. What I'd like to see is a realignment
of the rules to concentrate on bandwidth restrictions only. Thus a
Clover or CW or FSK signal would be ok in the narrow bandwidth subbanda
and voice, SSTV, and Piccolo and the like would be ok in the wider
bandwidth segments. Concentration on modulation *methods* rather than
modulation *results* make the rules unnecessarily restrictive. This
doesn't leave a place for SS, but then current rules don't either.

>in the digital subbands.

Strictly speaking that's not completely true. CW is a digital mode
and it is permitted *anywhere* on the amateur bands. Then there's
SSTV, it's not voice, but is allowed in the voice bands. In fact
it's only allowed in the voice bands. SSTV is an interesting case
as well because it is in practice a digital signal transmitted by a
frequency and amplitude shifted carrier. That's because all current
generation SSTV equipment digitizes the video in a frame buffer.
It uses a 64 kb buffer that is transmitted in an 8 second frame
for an effective thruput of 8 kbs. This looks like a dodge around
the antiquated rules. We could load the frame buffer with data
and transmit it as a SSTV picture. The FCC doesn't require the
pictures to make sense when viewed on a monitor, except for the
ID every 10 minutes.

Even better, if we write the data in columns, read it out
for transmission in rows, and use matrix FEC, we have a rather
robust data system that should be able to shrug off burst errors.
This the way D2 digital videotape recording is done. When
the matrix is reconstructed, errors are smeared out across the
matrix so that the check bits for each row and column can be
used to reconstruct the damaged data.

Thanks to all who replied to my note; the suggestions were all the same and
they were simply, "use an inverter."

I never thought too much about an inverter because I don't know too much
about them. However, it does seem that using an inverter would use more
current than a car battery -> 12V/5V filtered converter. I don't know.

Once again, thanks, and I'll look into some of these inverter kits people

mentioned.

  Nonsense. You are making assumptions about using 1200 baud VHF links.
We can achieve much higher bandwidths using good compression strategies
and by moving up into the microwave region. My reading so far indicates
that 30-40 mile microwave links running 10 Mbit/sec should be possible
without outrageous investments.
  The existing packet network is very poor, but that's just because
it's dated. Technology very quickly becomes obsolete these days, and
we hams don't have barrels of money to burn.
  Ultimately, the packet network needs to put its backbones up in the
microwave region and run Internet speeds.

  Am I the only person out there who has given up on Rose in
frustration? Several folks out there suggested using Rose as
part of a link, but I have had maybe one in ten successful connects.
Worse, the connection often dies very quickly after being made.
Am I overlooking some trick, or just using Rose for something for which
it was not intended?
  This applies to the Shreveport, Dallas, and Houston Rose sites.
Note that I cannot hit *any* of these without going thru a node or
digipeater.

I don't know if someone has mentioned it yet, but there's an article
on this topic with construction plans for a contraption that revives
NiCads in the latest issue of 73.

But let me add my voice to those who urge caution when doing funky
things to NiCads.

And a Public Service Announcement:

If you give up and want to throw those old batteries away, please ask
the local garbage lords where you can ditch them. The cadmium in
NiCads is nasty stuff--it's a heavy metal and it will do bad things to
animals (including humans) that use any water source into which it
finds its way. In most communities it's probably illegal to toss them
in with your regular garbage. The fish and I thank you.

Hello!

After reading through all the doublespeak and non-information of
manufacturer spec sheets, It's time to get some expert help. I'm in the
market for a dual band (2m, 70cm) handi-talkie and need some solid
information from people that have used them.

I've been looking at the ICOM W2A, the STANDARD 558, and the KENWOOD
78. I have not yet got any info on the YAESU. From what I read in the

forums, Kenwood has a poor service department, so I'll pass on their gear. The ALINCO dual bander seems to have some software problems, so again I'll pass.

Questions:

Of the remaining hardware (plus any I've missed), does anyone have any good reason why I should buy one over another?

I would like to do high speed packet (9600 bps +) with the portable. I realize that I'm asking for miracles here, but does any handheld dual bander have a low enough phase distortion and proper bandwidth to do this? Better yet, if it works, what's the setup?

Also, what about mods to open up the RX/TX? I know the W2A can be opened up quite a bit. Others?

Nobody in our area has a Standard 558 - what does it come with and how well do you like it? The trade press and Standard disagree on this, so I'm interested in what users have to say...

Offbeat Questions:

Has anyone taken a commercial V.32bis modem and made it into something that would be useful for packet use? They're getting cheap enough now to make this feasable. I expect some modifications to the modem guts and possibly a "backend" of some sort would be required.

Any recommendations for mounting an Antenna on a Mazda MX3?

Closing:

Thanks in advance for everyone's help. If I get a good response, I'll post a summary so others will benefit.

Yours,
(^.^) Jason

Hey ho!
I've just been reading some FAQ stuff, but I'm not sure its answered my
question. So, here it is, like it or not. If not, please email direct.
Ta.

My dad is a ham (his jokes are pretty bad too) and he's in Wales (U.K.).
His call sign is GW3GWA, for anyone who's interested (yeah, he's been
going since before the Blitz...).
He has a bunch of gear set up for morse and voice communication both
locally on 2m and worldwide.
I'm not a ham, and have no license, but would like to communicate with
him. Assuming that he set up a rig and his computer for packet radio,
is there any way he could send info that I could receive on the Internet
(ie, to my email address) and vice-versa? I suppose I'm talking about
an internet-based gateway of some sort that could do the conversion.
Could this scenario exist without my requiring a license?

Thank you so much.
Tony.

Hi ...
     On our PBBS we run an open phone line. Anyone can call the PBBS and read and send traffic, licensed or not. Anything that a visitor sends is held. The sysop changes the message that was sent to go out under the sysop's call as third party traffic.
     There's the rub! You have to have a third party agreement between the two countries. I am not sure who Wales has a third party agreement with. I do not believe they have one with the U.S. (I will admit to only checking when the traffic demands pouring through all the back issues of QST to find the latest list). Disregard, I did have one on the disk, we do not. Hence, doing it through a U.S. amateur would be illegal.
     You are in a great time period for ham classes! They will be starting all across the country!
73,
Steve, NO8M

I have a couple of dead ICOM battery packs.

Does anyone know how to get the packs apart?

Does anyone know where I can get replacement cells?

Is this possible at all with the likes of BP8's etc????

Thanks, joe

Note also that, once you get the 95 running with a TNC and radio, you can use
a version of KA9Q NOS I've ported to the 95 to get on TCP/IP. It's available
for FTP on ucsd.edu. It works best with either a 1 MB 95 or a RAMcard, though.

>an internet-based gateway of some sort that could do the conversion.
>Could this scenario exist without my requiring a license?
>Tony.

The gateway I can help you with, but I require all people that access it
to have their ticket. With the new code-less licenses it is very easy to

get one. You can actually do it in a couple weeks. If you are interested
in how let me know and I will try to get you in touch with the proper
people. Once you have it, we can do a lot about getting you in touch with
your dad.

When you get your ticket send a message to gateway-request@arasmith.com
and I will register you with the gate and send you the gateway instructions.

Well, there's a lot of things which *COULD* be done, if <long list>.
Today's reality is - you don't have even 9600 bps. And it has very
little to do with data compression (or did you mean things like
multiplexing: frequency multiplexing/time multiplexing?).

|>   The existing packet network is very poor, but that's just because
|> it's dated. Technology very quickly becomes obsolete these days, and
|> we hams don't have barrels of money to burn.

OK, so the existing PBBS is very poor (and how does it contradict
the original statement about land BBS technology being a decade
ahead), and hams don't have barrels of money to burn to bring
the PBBS from obsolete to current level... Very nice. So far
you're proving the points of what you called "nonsense".

And there's very important point which you chose to ignore:
RESTRICTION ON CONTENT. Don't you think it counts?

|>   Ultimately, the packet network needs to put its backbones up in the
|> microwave region and run Internet speeds.

Yeah, sure...
And just when do you think this wish will become true?

  What do you mean we don't have 9600 bps? The nodes around Houston
are mostly running 19.2 backbones. It would be no great trick to
bring up the user ports to 9600 if the demand were there. And 9600b
TNC's exist; it's only a matter of time before they become the standard.
  If there's a problem with the current network, it's that it's
underutilized, and therefore generates little need to improve it.

Yeah, I realize that this is a Catch-22.

  Perhaps I read too much into the original posting. My gut impression was that the REAL message was "The packet network is not and NEVER WILL BE more than a toy."

> And there's very important point which you chose to ignore:
> RESTRICTION ON CONTENT. Don't you think it counts?

  Not really. There are restrictions in the content of Usenet postings too. The original posting listed three problems, too technical and one not. I have very little influence over political problems, but I can always hack some hardware together. :-) In other words, I simply chose not to address that issue, because it has never been an issue for me and I don't expect it to become one.

>>   Ultimately, the packet network needs to put its backbones up in the
>> microwave region and run Internet speeds.
> Yeah, sure...and just when do you think this wish will become true?

  Real Soon Now. Take a look in the 1992 Handbook; read the article in Section 32 on 10/24 GHz connections running at 2 Mbit/sec (with 10 Mbit/sec possible). I would guess another five years or so. Look how quickly the current packet network came about! When was the first commercially produced TNC offered for sale?
  Of course, I readily admit that if the landlines switch over to optical fiber and start running another order of magnitude of speed, we are not going to have the bandwidth available to match that. But we can certainly reach today's Ethernet speeds with a 10/24 GHz backbone, and from what I've found so far it needn't cost all that much. (I'm getting ready to do some experiments in the 10 GHz region, but so far it's still in the talking stage.)

>
> I'd like to locate some worm hole operators if any would come forward.
> (Or is there a list in QST somewhere?)

I'm one. I help run the Wormhole gateway for the ACT region in Australia
[44.136.0.x to 44.136.7.x]. mirrorshades.ucsd.edu is indeed gating packets
between the amateurs and the Internet.

However, you may not be able to reach some/all of the amateurs serviced
by the wormholes from the Internet for political reasons: allowing (possible)
non-amateurs to use amateur frequencies here in Australia is illegal. Packets
from the Internet eventually pass over amateur frequencies to get to their
destination. Thus, we have decided to setup barriers to the packets
originating from the Internet.

In other words, mirrorshades will pass your packets to us, we will discard
them. Your mileage may vary with other wormholes, but I doubt it!

Sorry for the wet blanket.

I've posted a couple of articles in the past about our attempts here in
Southwestern Ohio to build a (moderately) high speed packet backbone,
and a similar Metropolitan Area Lan.

We've now completed the first phase of the system, and have a backbone
linking Dayton, Cincinnati, and Columbus through a set of 19.2KB
point-to-point links (5 node sites in all), and a full-duplex 19.2KB
packet repeater running in Dayton (currently with 6 users).

The system is built using the Kantronics D4-10 UHF DataRadios. It
works.

I won't take up a lot of bandwidth here with a lengthy description, but
if you're interested I'll happily email info about this system.

I have a couple of dead ICOM battery packs.

Does anyone know how to get the packs apart?

Does anyone know where I can get replacement cells?

Is this possible at all with the likes of BP8's etc????

With the likes of BP8s it is easy to get it apart, just unscrew the screws and pry the halves apart.

Several companies make pre-made "inserts" to replace the cells in these packs. Periphex has been my favorite at 800 634-8132.

The newer "S" series of packs are ultrasonically welded and cannot be fixed, at least they were not designed to be.

Any details, please? Technical preferrably? What kind of equipment? Frequencies? Bandwidth?

|> And 9600b
|> TNC's exist; it's only a matter of time before they become the standard.

Yeah, that was my slip. Of course 9600b TNCs were there even several years ago. Still they don't seem to enjoy much usage...

|> If there's a problem with the current network,
|> it's that it's underutilized, and therefore generates
|> little need to improve it.

Well, I disagree. Today's PBBS is pain in *** to use, because it takes almost MINUTES to get ONE string through. Surely, higher speeds could improve response time, which I'd think would be welcomed by everybody?

What's then the reason(s) it's not used? Just the lack of widely available 19.2Kbps and faster TNCs?

|>   Perhaps I read too much into the original posting. My gut impression
|> was that the REAL message was "The packet network is not and NEVER WILL
|> BE more than a toy."

Yes, I think you read too much there. I think it was an answer
to something like "whether it's worth to try to establish
Internet-like network on the radio?". And the answer
was: "No, today land-line BBS is much cheaper and
far more effective than PBBS." Which I
completely agree with.

About "never will be more than a toy"? Well, I don't know.
If military can transmit zillions of data over very wide
band UHF links - why can't we utilize similar approach?
On the other hand - apparently we haven't so far...

|> > And there's very important point which you chose to ignore:
|> > RESTRICTION ON CONTENT. Don't you think it counts?
|>
|> Not really. There are restrictions in the content of Usenet postings
|> too.

Well, Usenet restrictions are MUCH less, err, "restrictive". And
you don't lose your license for violating them either (:-).

|> The original posting listed three problems, too technical and one
|> not. I have very little influence over political problems, but I can
|> always hack some hardware together. :-)

Yeah, sure, but the point is - if this political problem
[potentially] can deter [potential] users...   What's the
reason for building a complicated [and expensive] network
you only a handful of users, if most of those, who could
benefit from such a Net would go elsewhere (since there's
at least one choice - Usenet, to say nothing about lots'n
lots of land-line BBS's)?

I doubt that those who'll start HighSpeedPBBS project can
ignore this issue.

|> In other words, I simply chose
|> not to address that issue, because it has never been an issue for me
|> and I don't expect it to become one.

Ah, that's understandable. But that it's not an issue for you still
doesn't mean that it can't drive many other "customers" away.

|>   Real Soon Now. Take a look in the 1992 Handbook; read the article in
|> Section 32 on 10/24 GHz connections running at 2 Mbit/sec (with 10 Mbit/sec
|> possible). I would guess another five years or so. Look how quickly
|> the current packet network came about! When was the first commercially

|> produced TNC offered for sale?

Well, I believe about 1989? One or two years earlier?

|> But we can certainly reach
|> today's Ethernet speeds with a 10/24 GHz backbone, and from what I've found
|> so far it needn't cost all that much. (I'm getting ready to do some
|> experiments in the 10 GHz region, but so far it's still in the talking stage.)

So unlike me, you are doing something constructive in this area (:-).

I am trying to get the the voice of Israel on my old (15 year old
Radio Shack Realistic DX 66) SW radio, and I just barely managed to
do it several times, but the reception was terrible.
   I am looking for some advice as to what I need to do to be able
to receive it.
   Will a new digital radio help very much? Or do I need an excellent
antena. (up to now, I just hooked up a long wire to the radio and
hung it outside the appartment).
   If the answer is that a good antena will probably do the trick,
then do you know where I can get one, and what I should get?
   At HAM-Radio outlet they wanted to sell me an "eavesdropper" antena
for $80 . Do I really need to invest that kind of money in an antena?
   With regards to the radio, I heard that most of the "commercial"
(ones offered to the general public rather than the ones that the
serious amateur buys), are not very good in terms of sensitivity and
selectivity. Is that right? Specifically I have seen a sony ICF 2010.
Is it also rather poor on the specs side? Do you know of something
that is good on the reception side of things and not necessarily so

strong on the glitz? Do I really need to invest hundreds of dollars (or more) in a good receiver?
   If you know how I could get a decent cheap SW radio, I'd appreciate it too.
   Thanks for your time and help,
                                    Gideon.

Bradley,
I don't recommend shorting the cells out as you are doing. I doubt that it helps, and I am afraid that you and/or your equipment may be damaged by doing so.

    After years of trying non-scientific (i.e. pass/fail) means of rejuvinating my ni-cad's I have adopted the following. I try to charge the individual battery or cell "normally" with a 1/16 C rate. If it is in a pack of cells I open the pack and isolate the cell with jumpers, alligator clips, or straight pins under the insulation. If that doesn't work I give it the shock treatment. I happen to have an old RS CB power supply, it puts out 2 Amps continuous and 3 Amps peak at 12 Vdc.

    I apply the output from the power supply to the offending cell(s) until the circuit breaker pops. At that time I measure the cell voltage and, if it is anything but 0 V, place it under normal charge for 16 hours. If the cell does not show any voltage I repeat the shock treatment a few more times. If it doesn't pick up I figgure that I have fried it and toss it out. If it was a cell in a pack I remove and replace the bad cell. I seem to have a fair success rate with this method, and have never had a cell explode or change shape.

    An alternate method which I have read about but not experimented with sounded interesting:
    The author used a scale to measure cells before use, and after they would

no longer charge. He found the latter cells to be lighter than they were originally. He injected distilled water till they were their original weight and claimed that most would begin functioning again. Sounds feasable, no?

    Anyway, welcome to the world of the rechargeable cells. Be sure to let everyone know how your experiments come out!

    I do have a router sitting on the Internet and that talks to our local amateur tcp/ip group. Since 44.x.x.x is not routed my direction (and I wouldn't want it to), amateurs need to telnet into my unix box (kumr) and then they can telnet out to the Internet. Mail and news can be routed via kumr to/from the Internet and the amateurs that are in my local area. I haven't set up a worm hole at this time. If there is interest, I would like to look into it with folks.

         Tim

I'm looking for a packet driver so that I can use NOS on a 286 with an
Excelan EXOS 205 Ethernet card. Does anyone know where I can find one?

Please reply by mail; If there's interest I'll summarize to the net.

     Thanks!

A friend here has a KPC 2 with 2.x software rom(s) dated about 1986?

Will this unit support kiss mode ?, if not where can we source the code
to blow a kiss rom for this unit, or a later rev of the normal software.
Can it be mailed, purchased, if so from where/who ??

I have my Yaesu FT-727R connected to a PK-88 TNC. The TNC has been
adjusted; the system can receive packets fine.

However, when I send packets, the HT gets keyed and then stays keyed
even after the TNC isn't sending anything.

If you are using a 727 for packet, what values did you use for your
TNC->727 cable? The pk-88 manual suggests using a 0.1uF Cap and a
2200 Ohm Res for the connection, but another book suggests using
1000 Ohm and any cap between 1.0uF and 0.01uF.

I have tried a 1000 Ohm Res and 1.0uF and 0.1uF caps (and other sizes)
with no success -- the HT stays keyed or, for large resistances, doesn't
key at all. I'll try the 2200 Ohm res tomorrow.

Any ideas? All hints are appreciated!!

Message-ID: <1992Aug29.141710.18255@anomaly.sbs.risc.net>
Lines: 31

Recently, I was talking to some hams in the area who are involved in modem
BBS communications. They had never tried packet radio, so I said: Gee,
wouldn't it be neat if you could access my TNC and utilize packet via my
BBS.

This is very possible, since my TNC is connected to a serial port on my
UNIX system. All I would have to do is establish a command and appropriate
security on my BBS to restrict TNC access to registered Ham Radio operators
only.

Now, the question becomes: what type of legalities should I be concerned
about?

This isn't quite "repeater operation", but I assume I would still be the
control operator of the equipment, since it is, after all, my station.

How would the remote-access Ham set MYCALL on my TNC? THEIRCALL/MYCALL?
THEIRCALL via MYCALL?

Anything else I should be concerned about?

I'd be interested in hearing from other people who have worked on a similar project.

MD

If they were hams, they could very well be control operators of the
station. They would be operating it on remote control.

> How would the remote-access Ham set MYCALL on my TNC? THEIRCALL/MYCALL?
> THEIRCALL via MYCALL?

Probably the best mode is to make the thing function like a node. The
thing would source packets that appear to come from the user's call
(but via your station). Theoretically, they could just set their call
on the TNC though and still be legal.

While I agree that solving the local connectivity problem deserves a *lot*
  of attention, and that INTERNET wormholes are becoming a way of life,
  I think that solving the longhaul problem *on amateur radio* is also
  worth persuing. There exist a motherload of linked voice repeater networks
  today, some of them covering vast distances (IPARN, for a Canadian
  example). It is my believe that much of the site/power/antenna/political
  engineering in these networks can be leveraged for use in *real* high-speed
  digital networks that carry both voice and data. That, I think, is a

vision worth persuing.

Hi Dave...

I could tell you where to post it.....

but the last time I asked the same sort of question I didn't get any good
answers. I wanted to post copies of a few of my ham radio software:
DOSGATE, AUTOCALL, AUTOLOG, AUTOFAX, AUTOCW, and a windows program that
converts metric/english(american) measures.

If you find a good place to post this stuff... let me know.

The U. of Maryland Club is going to be looking into obtaining
DSP Modems for high speed and satellite packet work. My question
is

1) How many DSP modems are available?
2) What is your experience with any of the above or
    what have you heard about tradeoffs between the different modems

Please email me and I'll summarize.

-Thomas

jangus@skyld.UUCP (Jeff Angus) sez:
>The MFJ-1270b does not have "true" DCD ...
You mean a fully functional DCD. They detect DCD with a state machine (digital),
but when it drops out due to noise or signal strength, the packet is lost by
another (impatient) TNC starting to transmit. The DCD mod from TAPR hangs
the DCD on to allow for this poor noise response.

>Since most VHF packet is done on FM, and most FM stations are either there or
>they aren't, simple 'is there noise present' DCD works.
But this is flawed as this requires your Squelch control to be on threshold,
or at least track the background noise. In practice, many set the control
too high and cause hidden transmitter problems. Idealy, the squelch threshold
on typical rigs should be set so that it breaks open with no signal about
once every ten seconds ... `just' on threshold.

>Unfortunately it also thinks the channel is busy when it hears music, voices,
>intermods etc.
And this is BAD? Ok, so you want to transmit a packet when you have no
hope of hearing the ack packet? This causes a problem ONLY for impatient
people that know not what they do.

>The trick to HF packet is to set the receive audio level so that the background
>noise just barely get the (stupid) DCD circuitry to flicker and then back off a
>bit.
True, but a state machine (digital) DCD still works better here than noise
based units.

>You mean fully functional DCD. They detect DCD with a state machine (digital),

No, the MFJ1270 uses the XR2211 demodulator. It's an analog PLL device.
There is a state machine in the TNC, but it's used to recover clock and
perform the NRZI->NRZ conversion. It doesn't do carrier detect. You
could make it do so, but it's easier to add in a second one on a
piggyback board like the TAPR deal.

>>Unfortunately it also thinks the channel is busy when it hears music, voices,
>>intermods etc.

The real reason for wanting a DCD that isn't noise-based is so that you
can leave your squelch open, because it takes a lot of radios a good
portion of a packet time to get their squelch open. More than half of
the TXD that people wind up using is to compensate for the receiver's
squelch opening time, not how long the TX actually takes to key up.

>True, but a state machine (digital) DCD still works better here than noise
>based units.

A good state machine will lock on only when the bits look like real
data, so it doesn't matter what the crud on the channel looks like.
That would always be superior to the noise-based DCD.

However, might you want a separate noise-detect unit to perform
collision avoidance.

K2CC (clarkson university, Potsdam, NY) just started running ka9q's NOS
on 2m with netrom routing to the rest of the NEDA net.

I used a netmask off of clarkson's net to assign some starter IP
numbers, but I would like to get a real amateur netmask. I'd also like
to find a netrom route (or innernet) to the rest of the amateur tcp/ip
net.

where should I go for this information?

Various comments about MFJ, their MFJ1278, Multicom and service have
been left in this echo.

I have only owned 1 TNC and it is the MFJ1278T with the 3.3 ROM. I love
it. I also sent my free EPROM upgrade to them at the end of 1 year and
heard nothing. I figured it was a lost cause but 6 moths later 1 called
them, sat on hold for 5 minutes while thye looked for my order; and
hot-damn; they found it. They said it was "on hold" as they were just
releasing version 3.5 and mine would be shipped in a week. Well double
hot-damn; they did ship it and as they said and I got it a week later
via US Mail and Canada Post.

I find Multicom inadaguate for packet work and prefer the Aussie paKet
5.1 terminal program. If you are into Afx and Multi-gray scale or SSTV
then Multicom may be your answer. I first got it 18 months ago and was
instantly annoyed by the copy protection. Its not that good to be
concerned about pirating. However I found I could make extra backups
for myself using the Copy2PC board with the setting for "copy with weak
bits". These copies saved me in the early days of packet
experimentation. Once I deleted a Multicom subdirectory without
restoring the software count back to the floppy (you are allowed 2
copies - that thought gives me anxiety attackes just like the days of
the original Lotus 1-2-3).

So with a little prodding MFJ did deliver and with a little insurance
 by getting an extra copy of the Multicom master disk you should be
okay.

After many years of sitting by the packet sidelines, I've set up a KAM
and started decoding the burps. As someone who uses the Internet
daily, this has been an eye-opening experience for me.

As someone recently noted ham packet, as currently practiced, is an
adventure in low-performance communications (but cost-effective). Yeah,
with incredible patience and luck, I've managed to connect from Phila-
delphia to Maine. I've seen umpteen users competing for a single
1200 baud port to a PC. And I note that 10s of kHz of precious HF
spectrum are taken up by very unfriendly robots chatting at **300 baud**.
(They won't give you the time of day, and the throughput is abysmal.)
Now I see there's a big brouhaha about the ARRL not defending these
terribly inefficient mail operations to the maximum of its ability.

The contrast with the Internet is incredible. I can easily transfer
a megabyte per minute across the country, and I am somewhat annoyed
I can't do better. I can send dozens of e-mail messages around the
world and often get replies in minutes. But you all know that.

My question here is where does one go for information about digital
ham networking plans - especially the (very logical) use of Internet
links for long haul? It's not in QST, I think. :-)

Until I get better adjusted to VHF packet, you'll probably find me
on 20 m AMTOR. There's a friendly medium! Not much good for downloading
software, however.

Cheers and 73s, Martin, AA6E

>whatever is available to get the job done. [...]

I agree. Look at what happened to the railroads during this century.
They should have known that they were in the *transportation* business,
not just the train business. The airlines dominate the transportation
business now. Railroads are good for hauling freight (I know, oversimpli-
fication).

Hams are in the communications (non-)business. Read section 97.1.
We have these precious frequency allocations because (among other
things) we push the state of the art, and not just by radio. You
will never advance in any area unless you see the big picture.

My wish list is to find an on-line Callbook server that
has a listing of packet BBS calls by City/State. If no
server, does anyone have a listing?

Sure would be nice to be able to lookup Austin, Texas
and find N5LJF.#AUS.TX.USA.NA who runs a full-service BBS.

On more than one ocasion I have wanted to send a msg to
a ham in a city and had no idea of the BBS callsign.

Are you listening ARRL for the next Repeater Directory?

Well, it took a few days of banging my head against the wall, but I did get
the TAPR 9600 baud modem working with the MFJ-1270b TNC. (Note while I was
waiting for the ringing in my head to stop, I accidentally read the manual.)

I am now trying to get same said modem to work with the PacComm Tiny-2 TNC.
I did the same 'cut jumpers' on the 20 pin header that I did on the 1270 but
the PacComm Tiny-2 seems to insist on being a different bird.

Anyone out there already do this? Also, if you've 'married' this modem with
other TNC's such as the PK-87/88 or the DRSI cards please email some notes
for those mods as well. I try to maintain a library of hardware connections.

Thanks, 73

Make that three votes for a big Question Mark concerning packet.

I, too, just received a BAYMOD-9 from PaccCom. At 60 bucks it seemed like
a cheap way to see what all the broo ha ha was all about. Well, after
spending two nights here in the Boston area seeing the same
information, messages and mail going back and forth at 1200 baud, I'm
not sure what the big deal is, either.

Sign me... another kid spoiled by the Internet!

I finally got my new 1270B TNC running, talking to my computer at 9600 bps,
and receiving packets. I calibrated the transmit audio level, and I verified
hearing packets, using a separate receiver. But I have not been able to
connect to any other stations! I tried increasing TXDelay, but to no avail.
I am on 145.030. Could I just be in a poor location, and no other station
can hear me? Someone please give me advice. Is there a good station near
114th Street on the West side of Manhattan (NY) that I can try to connect to?
I also have 440 MHz capabilities. Thank you for all advice.

73,
Meir

I left these out because they aren't amateur radio. They work, and
as long as the commercial and institutional networks tolerate them,
they are useful, but they aren't amateur radio. We could just abandon
packet *radio* and all run Fidonet landline BBSs, but that wouldn't
be amateur *radio* either. The thruput would be better though.

For communications *systems* use, the wirelines are superior to
radio in ordinary day to day long haul service. But we're supposed
to be *radio* amateurs, and the data is secondary to the medium in
our case. I know that's a limited way of looking at things, but
amateur packet radio is a limited form of communications. After
all, if communications efficiency were our only goal, we'd make
long distance phone calls instead of cluttering 20 meters with
kilowatt DXers.

I have a AEA PK-88 TNC and the
ROM is upgaraded to the June 1, 1990 version. As there are
quite a few bugs in this ROM, could you please let me know
if there is a more recent ROM upgrade for PK-88?

Thanks

My slant on this is that radio is uniquely good at local/portable/mobile
data communications. Something I dearly wish I could do now (for work)
is to get 38.4 or 56 kb/s from home to work. Ham radio could be doing
this. (Alas, not for work!) Ham radio can never hope to compete with
NSFNet (Internet) in MB/sec around the country or world. But (until
ISDN or until normal phone modems get much better) radio (in GHz
bands, probably) is the right solution.

The economics seems right. Hams are willing to spend $100s to get connected on packet. Soon, this should get you up to 9600 bps for local communications to a hub node/bbs. The hub node/bbs systems seem to be able to command $1000s from clubs or fat cats. That should be enough to cadge an Internet connection from the local U, too.

I can't see the value in ever trying for transcontinental ham links at any speed, when Internet is free and reliable. (If ham satellites can be done "free", I should think Internet connections could be.)

There's a lot of value in long radio links connecting very remote or non-industrialized areas, but that's not my focus here.

Just some random ideas from an inquiring mind. (Maybe the honchos are working on this already?)

Well, I am now into packet. This weekend I received the Baymod-9 modem-in-a-db-connector from PacCom and version 1.50a of the Baycom terminal program.

Problem is: I don't have the foggiest idea of what any of this means!<g> (its not up to my usual heathkit standard of explaination!)

Anyhow, I was successful in making the physical connections necessary to connect my Alinco DJ-F1T and in sending and receiving some packets from a local Node(?). I was also successful in connecting to myself through the node, so I think all is working fine. However, I am not sure how to adjust any of the parameters so that I maximize my communications while minimizing the generation of packets which cause collisions.

Is there a Baycom guru who can provide me with some advice on how to use this system to its fullest advantage, in simple Ham engilsh? Also, any

advice on how to check whether I have the controls of my radio set properly
would be appreciated. Finally, I see all of the (what I believe to be)
AX.25 "stuff" going across the bottom of the screen, and I think that if
I understood what I was seeing I could tell how efficient my transmissions
are being, but right now its all GERMAN to me <g>

Many thanks to all in advance! (FTP sites for info also appreciated!)

73 and tnx! de KA2TMT

Hi people,

I'm interesting in building a small packet modem. The problem is by
TCP/IP : I need the KISS protocol.
Does exist a piece of software that implements KISS such that it would
possible for me to use the TCP/IP protocol?
I don't see another way to solve my problem :-(

Thanks for any help.

Packet certainly isn't the Internet, but a lot of people in other
countries, or for that matter, young people, people with non-technical
professions and many others in the developed world *do* have access to
ham radio.

Those of us with some experience have seen a lot of progress... When I
first got into ham radio I made many interesting (to me) contacts with
5 words/minute Morse, and by the time I got up to 20 words/minute I
realized it was true that, given all the abbreviations possible with
Morse (the equivalent of modern digital compression techniques?) and
all the non-informative time-wasting words that are heard in the usual
voice radio contact, it was true what the old-timers said, that Morse
can be a satisfying way of carrying on a conversation and transmitting
useful information.

My first on-line experiences were with a 110 baud modem. It hurts now
when I have to use 1200 instead of 2400 baud to connect to some
systems, but back then 110 baud opened up wonderful possibilities for
access to powerfal facilities, file transfer, and e-mail.

My first computer had 256 bytes of available memory which could be
programmed only by switches that entered data in binary. I would
never go back to such a system, but at the time it presented an
enormous range of interesting, and, yes, even useful possibilities.

At a later stage that computer used cassette tape at 2400 baud for mass
storage. It seemed OK at the time, but when I got a floppy disk I never
wanted to go back. When I got a hard disk I never wanted to use
floppies again. My Apple seemed pretty fast before I saw an XT, and

that seemed fast enough until I got my 486...

The point I want to make is that at each level there are useful things
that can be done. Let's not discourage those who don't have Internet
access by denigrating packet radio. Packet is still useful for many
purposes.

Just as with the comparison I made between efficient Morse and sloppy
voice communication, it is worth keeping in mind that wider bandwidth
and faster hardware doesn't always get the job done better. When I
graduated from a 256 byte to a 16 Kbyte computer it allowed me to write
programs in BASIC rather than setting bits, but the programs actually
executed more slowly. Much of the power of today's PCs and Macs is used
to create easy-to-use graphic interfaces, but the programs that run in
these environments are slowed because so many resources are being used
to provide user convenience.

Well, not really. True, the 7-bit AMTOR code maps one-for-one to Baudot,
but it's a different code. If you doubt it, try transmitting a SELCAL
using the 5-bit code and see how many stations link up to you! (Granted,
a nit.)

>Meanwhile, *compression* is done at the *text* level, not
>the character level. For example, I could zip a file and then uuencode

Which goes to show the idiocy of the existing regulations.

Hi,

I went to Ham Radio Outlet in Atlanta in the weekend. The
salesman told me that there is a radio made by AOR
which has all the Icom R1 coverage (.1 - 1000 Mhz) plus SSB

capability. But the salesman could not remember the model number.

Does anyone know what is that radio name?

Thanks,
James

Why are you surprised that hams have been unable to duplicate a network
that cost millions to install and maintain? Having said that, we
should be doing a *lot* better than we are.

>My question here is where does one go for information about digital
>ham networking plans - especially the (very logical) use of Internet
>links for long haul? It's not in QST, I think. :-)

One place to look is the proceedings of the Computer Networking
Conferences. These have been held annually for 10 years, and most of
the "movers and shakers" of packet have published papers.

I left these out because they aren't amateur radio. They work, and as long as the commercial and institutional networks tolerate them, they are useful, but they aren't amateur radio. We could just abandon packet *radio* and all run Fidonet landline BBSs, but that wouldn't be amateur *radio* either. The thruput would be better though.

For communications *systems* use, the wirelines are superior to radio in ordinary day to day long haul service. But we're supposed to be *radio* amateurs, and the data is secondary to the medium in our case. I know that's a limited way of looking at things, but amateur packet radio is a limited form of communications. After all, if communications efficiency were our only goal, we'd make long distance phone calls instead of cluttering 20 meters with kilowatt DXers.

What!?

Next you'll be telling us it's only a hobby and we should have fun.

I recently came across A&A Baycom packet modem kits in an ad in WorldRadio.
Has anybody had any experience with these kits? I am really tempted to buy
one at the $60 price. Do the kits come with explicit instructions for
wiring the kit to common HT's and radios?

I would also appreciate comparisons of the A&A kits to those sold by
Ramsey. (I don't want to hear simply that a "Baycom kit is just a Baycom
kit." Please make specific comments.)

Thanks.

MM> Does anyone have any comments regarding Hostmaster vs Ka-Gold for a KAM?

Well I have used both. There is a lot of difference in the two pieces of software, but each does do similar things. The KaGold is a very nifty piece of software. I am reviewing it in the next issue of the RTTY Digital Journal and have previously reviewed the HostMaster II.

There is a test drive of the KAgold which is available I would try it before I purchased it. The KaGold so far seems to win the race. Its fabulous on Packet and works quite well in the other modes. Has some very nice features. I think the HostMaster's screen is easier to configure.

KaGold does things quite different from traditional amateur software, it has conferences, file transfers and lots of bells and whistles. Hostmaster II seems to do most things fine. Both are examples of pretty good software in my opinion and each harness' the power of the KAM.

Each also still has some minor bugs in the software. Gosh they hate it when I point those out :-) But each appears to still be in dynamic change. I think that some of the features in HostMaster II grew out of things in KaGold, which is a nice competitive spirit.

Apologies if this is a stupid question, but I've read through the
Handbook and the Operating Manual, and can't find a clear answer:

How do I call CQ (or listen for and answer one) on HF Amtor?

I hear lots of very clear signals, that I can LISten to, but I've
never seen a CQ or one being answered. I've got an MFJ 1278 and
several varieties of terminal programs from XTALK to LANLINK2.0,
but I can't for the life of me figure out how to start!

Thanks!,

When I first heard that packet radio was only 1200 baud I was taken
aback! However the first thing I saw were ads saying that you could upgrade
your packet modem to 2400 baud. As the prices of packet modems start
dropping down to resonable levels you will see higher speed modems
becoming more common. In the next 5 years 9600 will be close to the norm
and not 1200 baud. Packet radio reminds me of the first years of computer
communications. Overpriced slow speed modems, no real standards etc...
Right now here in the Bay Area there is just now a 9600 baud link being
put in to speed mail forwarding through the Bay Area. For some reason
1200 baud is the standard and not 2400 baud. 1200 baud was dropped as a

standard years ago in the computer world. Is there any reason why 2400 baud is not the standard now? Part of the problem is none of the companies are selling a 2400 baud TNC for close to the same price as a 1200 baud. The 2400 baud chip set has been out there for quite a while so it isn't like it's brand new technology. Interesting question here, is ham radio technology driven at all?

Jeff

Well 300 baud does seem slow to someone who uses the government's
multi-million dollar internet. However, 300 baud was hot stuff on
telephone lines 15 years ago. And unfortunately it's as fast as the
FCC will allow on HF right now. There's no *technical* stopper preventing
faster operation. It wouldn't use 200 Hz shift FSK however. If you want
to talk about slow, the 45.5 baud AMTOR is slow, and can't even handle
a full character set. It's persistent in the face of errors however, as
is packet.

Today, the only practical use of HF is for robotic forwarding of Email.
The performance is too low for any other use. The robot has greater
patience than humans and will continue to try until the error free
transmission is successful. This is "good enough" for the volume of
mail currently in the system. It's not "good enough" for the various
other proposed uses of packet.

There are techniques on the horizon that would dramatically improve
HF thruput. Clover and Piccolo use multiple carriers to transmit
bits in parallel. That speeds thruput while keeping individual symbol
times long enough to prevent fading and noise bursts from corrupting
them. Spread spectrum is another technique that promises high thruput
in the face of noise and interference.

Direct FSK symbol encoding is second only to AFSK in being spectrally
inefficient and error prone on a HF channel. PSK methods available
today can push 9600 baud over good HF channels. But the rules prevent
it.

The VHF/UHF systems *can* be much faster. We use 56 kilobaud links
in our network. But as KA9Q and I have been discussing, multiple
hops run into problems of long delay times. The AX25 protocol is
not well suited to dealing with this without a supervisory transport
protocol and considerable RAM buffering in the various switches.

IMHO, outside the local area, packet is useful only as a forwarding
medium controlled by automatic equipment with the patience to deal
with the large delays present in the system. The kind of speed and
interactivity associated with the internet requires high speed landlines
and intelligent routing and buffering. All of that costs a lot of money,
and amateurs haven't shown an interest in setting up multi-million
dollar dedicated linking systems of comparable performance.

Combination systems that use the internet for long haul transport
exist, but they really contravene the spirit of amateur networking.
Riding as they do on leased lines owned by government and industry,
they don't form an *alternative* communications network capable of
helping out in an emergency when the landlines are down. If using
government leased lines is the only way we can do high performance
networking as radio amateurs, then I think we shouldn't bother
trying to do high performance networks. The government has already
shown that they can build and support landline based high performance
networks. If we go that route, then we're the same as a DXer trying
to claim credit for a contact he made via AT&T.

The subject says most of it. I'm wondering if anyone has a replacement
prom (or the code to put into it) to allow the Heathkit HK-21 pocket packet
tnc to have a KISS mode. It would be nice to have a portable tcp/ip station at
times and I bought the HK-21 back before KISS was popular so I didn't know that
its omission was a large flaw. I would really not like to have to go and buy
a new portable tnc when I've already got one!

BTW - I have extremely limited resources to pull anyhting from an ftp
site, so if someone could send me it by mail uuencoded, that would be super.

My address is gettys@regent.enet.dec.com

> How do I call CQ (or listen for and answer one) on HF Amtor?

Well, first CQ's are done in FEC mode. As a matter of fact you've
got a 70% chance that if you hear a FEC signal it's a CQ (either that
or it's an ARRL bulletin). CQ looks pretty much like a standard RTTY
one except don't send RY's (if you were inclinded to do that on RTTY)
and send your selcall. Mine looks something like this:

    CQ CQ CQ DE WO2L WO2L WO2L (WWOL)
    CQ CQ CQ DE WO2L WO2L WO2L (WWOL)
    CQ CQ CQ DE WO2L WO2L WO2L (WWOL)
    HERNDON, VA QRR ARQ/FEC SELCAL WWOL

Most of the first part is just to make the FEC signal long enough for
people to notice it and lock up. Put your call/selcal in the front
part PLEASE. It's such a pain to have to sit there and watch two
minutes of CQ to find out who is calling and I can be typing the
SELCAL ahead if it's given early.

The last line (other than my QTH) indicates I'm ready for automatic
replies (either ARQ or FEC). After this is sent I go back into
standby (not transmiting).

To answer, just push whatever you push to initiate a ARQ connection
and enter the SELCAL (or just call him back in FEC mode with the
normal hiscall de yourcall. I've had FEC QSO's, most noticably with
some guy on Diego Garcia who's surplus SITOR equipment wouldn't eat
WWOL as a SELCAL and my AMTOR thing wouldn't eat the numeric call he
could enter in his.

Hmm. Can any of the OSCAR satellites talk to each other? It occurs to me
that if there were enough OSCAR satellites in LEO, they could perform
real-time packet routing between themselves to provide a long-haul backbone.
The problem might be that they'd have trouble hearing each other without
dish antennas, and if they were in elliptical orbits, they couldn't rely on
fixed-aim dishes. If the satellites were sufficiently close in angular
separation, perhaps dedicated earth stations could perform the inter-satellite
relay function. 4 hops would cut the effective throughput to under 2400 baud
(for a single packet that requires a reply, that is; for bulk data transfer
using FTP and TCP/IP, say, where acks aren't required for every packet, the
throughput would rise toward 9600), but that's still well above the current
300 baud HF links.

Routing would be an issue, but if the earth stations knew the approximate
geographic location of each IP address, it could easily make a good guess as
to which satellites (if any) are visible to each destination.

No doubt this idea has already been beaten to death by the hard-core pacsat
folks.

    Yup, I know of several sites that do routing in and out of Internet with slip and ethernet with the KA9Q code.

The Internet is *not* free. Our use of it is parasitic and subject
to the whims of government and corporate sponsors. Ham satellites
aren't free either of course, we hitch rides on other people's
missions. HF is a unique resource to which hams have free access.
Our charter is to advance the communications art. We have the
opportunity to advance beyond what commercial users are doing

and break new ground with long haul data communications via HF
radio.

>There's a lot of value in long radio links connecting very remote
>or non-industrialized areas, but that's not my focus here.

Yes there is, and in addition there's value in connecting rural users
right here in the industrial US and Canada. And there's value in
establishing alternative paths to wireline services for use in
emergency situations.

I should say that I have no objection to internet connections. However,
I don't want internet connectivity to be used as an excuse not to
pursue alternative HF technologies.

I would be interested in hearing from anyone that really has the
solid scoop on how to implement hardware handshaking on a PC running
4.05 BPQ with a "Netrom" type diode matrix using 3 or 4 other TNC-2's.

The BPQ documentation implies to me that CTS and RTS be wired togeather
at the PC end, and that CD is used to inhibit BPQ serial port transmission
while the RTS line is used to tell the matrix that the BPQ node is
transmitting.

I could not seem to get this to work correctly, and I could find nothing
coming out of a diode matrix that would work properly when hooked to the
CD line on the BPQ serial port. The matrix is using CTS and DTR from
the other tnc's, as described in the various TheNet and NetRom descriptions
and works perfectly.

If any reader really understands exactly how this is supposed to be hooked
up, I'd sure appreciate being able to talk to them.

Yes, but universities are effectively in the same boat. I think
it's fairly safe to piggyback on university network access. (We need
some precedents to be set just to be sure.)

Sure, just be sure that you see technical "payback potential". HF at 300
baud with robots shows how to fill up spectrum all day long, but that's
actually unhelpful. If we could do reliable 9600 kb HF data with exotic
modems, meteor bounce, or what have you, I'd like that!

Effective emergency communications is a traditional ham strength,

and it has very good PR value (like justifying a lot of our spectrum).
But this is largely a local problem (we pray). Existing
packet and BBS technology seems quite appropriate, maybe with
regional or national Internet(?) interfaces.

>I should say that I have no objection to internet connections. However,

We keep reminding ourselves it's a hobby, and people have to have fun.
So I keep on seeking those weak 20m CW stations, even though I could
dial them up for a few bucks. On the other hand, if I'm going to
spend $$ and time getting into a new mode, I'd like to understand
where it's leading, especially when it is intimately involved with
such a well-developed technology base as computing and data networking.

HF is only a dead end because everybody has got themselves locked into
the wrong technology. The military bods have been running good 1200 baud
over a 12.5KHz SSB channel just by choice of better hardware and systems.

To start with they are using higher quality modems and filters with
automatic tuning to avoid drifting of the rigs being a problem. Secondly
they are using ECC at about 2000 baud to give an error corrected
1200 baud link. If they can do it why can't we ?

You guys are missing the obvious answer here, most hams are not internet
users, have no idea how slow they are actually running, and are cheap :)

I run a packet BBS that has about 600 users. Mine is different in that
it supports landline and internet access as well as the traditional 1200
baud tnc access. What I have found is that half my users don't own a tnc.
Why, some are turned off by the performance others the
fear of not knowing how to use it and still others that don't want to
invest in the equipment.

Out of the 300 users that don't use packet, 75 access the bbs purely by
the internet gateway. They probably do it for the same reasons.

I tried last year to get a group purchase together for my users of
9600 baud plug and play equipment. For the price of around $400 they would
be up and running, with people and a bbs to talk to. I was suprised at
the meager response. I got less than 10 from my user base.

People argue, but when it comes to putting bucks on the table, the room
gets mighty quiet :)

Our university amateur radio club recently purchased a Kenwood TR751A 2m
all-mode rig and a Kantronics KAM multi-mode TNC. Our problem is that we
can't figure out how to connect the two together. There's an external
speaker jack on the tranceiver--no problem there--but we can't see how to
connect the microphone and PTT wires. I know that you can sometimes get
along without a separate PTT connection, but the mic connection seems kind
of important. Anybody out there done this, or can point us in the right
direction? Thanks in advance!

(this is a flame)
this message is a waste of bandwidth, but I just spent another
2 hour session getting nowhere in getting my Ramsey Baycom modem to
key my Standard HT, and I have to drag Ramsey's name through
the mud after they've taken $70 from me and wasted so much of my time.

I have tried a lot of different things to get this to work, and
none of them have worked. It took me about 2 hours
to put the thing together originally, and I have spent at least
10-15 hours since then trying to get it to transmit on my HT.
A damn modem circuit shouldn't cause this much trouble...

Ramsey was no help when I called. Their ad says that their modem
will work with any radio... it probably will, if you can afford the
time and have the tools to re-work it to do so.

Ramsey's attitude seems to be that hooking the kit up to your radio
is your problem. Little things like missing components in the
original kit lose their relative importance on the scale of poor
quality in the face of this important failing.

Give me an A&E(?) PK88. Not only do they suggest circuits for hooking
their carefully conditioned circuit outputs to your radio, *but* I
hear that they even make a number of custom cables for popular radios.

Trash Ramsey.

Hello,

I'm looking for DRSI-card because a PacketCluster (first in former East Germany) will be build up.
 If anybody want to sell one (also already used card) which workes still you would help our group to install this Cluster quicker. The card we hoped to use was demaged unfortunatly last week by rain and following pc-crash. I hope for your PM and a good price.

>Does anyone know who the IP coordinator for Manhattan is?
>What is the closest packet-internet gateway to Manhattan?

I have experience with three ways of generating faster-than-9600 baud
HDLC frames:

1) Ottawa PI interface card. Definitely best performance, and lowest price ($120 US). Disadvantage: so far, only works with NOS, though with a Clarkson packet driver now available, that could change. We're using them in ways the designer didn't quite intend, and do see some packets fall on the floor. I think it's a software, not hardware, problem, though. You're on your own to package and interface a modem.

The Gracilis PacketTwin board is similar to the PI card, with the advantage of permitting onboard modems. I don't have any firsthand experience with it, though.

2) PacComm Tiny-2 "10MHz node version". This is simply the standard Tiny-2 but with a 10MHz clock and parts rated accordingly. Out of the box, the serial port will do 38.4 and the radio side 19.2. These can both be increased by dinking with the divider. I've put two into service at 19.2 and they work great. Price for the 10MHz version is about $150. PacComm sells 9600 and (I think) 19.2 modems for about $100. Since it's a TNC-2 clone you can use any of the high speed modems available.

3) Kantronics DataEngine. Nice hardware, but pricy if all you want is a TNC -- about $275 before modems. BIG PROBLEM in my book -- the KISS implementation works very poorly at high speeds, with <lots> of lost packets. The good news: Johan, WG7J, has just finished the alpha version of "Nos-in-a-Box" for the Data Engine, so with that code it could be the ideal platform for a small to medium sized switch (with two high speed ports and a couple of NetRom TNCs or a slip link hung off the serial port).

Hope this helps. I won't take up bandwidth with it here, but if you're interested let me know and we can talk offline about the architecture we're using for a 19.2KB metro area network here in Dayton, using Kantronics D4-10 radios as RF modems and avoiding the cost of adding an additional modem to the system.

John

KAM Data Engine and TCP/IP help?

A Dutch ham working in Nicaragua, Theo Vlaar, PA3CBH/YN1TV, wrote me
with a question about packet which is a bit beyond my experience, but I
imagine the expertise is out there on the net. Any pointers to
archived files or other sources of info would be appreciated. Please
e-mail to me at awoodhull@hamp.hampshire.edu

Thanks and 73,
Al Woodhull, N1AW

>You really can not blame MFJ for the software since they

>sub-contract the work and act only as agents.

MFJ is the contractor and would be responsible for setting the specifications for the contracted software. This would include the user interface, operating systems supported, hardware the software can use and so on.

And it's sold by them under their name.

     I'm still so surprised that this is still being discussed the way it is. At least some people are no admitting that you can run about anything you want as long as your intent is not to obscure your transmission.
                                ^^no=now
     We've had people here in Detroit gripe and complain about TCP/IP because they can't decode what we are saying (turn your PID or MPROTO on!). People have gotten on voice repeaters bad mouthing it saying that we send commercial software back and forth. Of course the only people that say that are the ones who have NEVER even seen a TCP/IP system work.
     Just because we use LZW compression for SMTP, NNTP and some convers linking, we do so to make packet more efficient. When someone complains and says that I am doing it illegally, I will challenge them to talk to the FCC and explain how they send plain text and hog up the frequency and I compress the messages and spend less time actually on the air and make better use of the frequency. Then what about things like NETROM transmissions, Texnet frames, etc... Those aren't plain text. Does that mean that they are illegal because someone monitoring can't decode it in plain text? NO!   If it had to be plain text then we would have nodes lists a mile long on the transmission. I'd have to increase the watchdog timers on the TNC's to transmit all that plain text. I believe that Texnet uses something like 5 bytes of information for it's nodes (any Texnet gurus out there)? How many people even have this information? It was published in one of the ARRL CNC papers a few years back.
     If you complain that someone is illegal because you can't easily decode a transmission, do one of the following:

     1. Ask the person. If you ask me I will probably invite you over

and show you how it all works
2. Determine if they are using the spectrum more efficiently than you are with your non-compressed transmissions.
3. Piece the transmissions back together and decode it yoursel.
4. Get a life!

As quoted from <1992Aug7.183829.455@porthos.cc.bellcore.com> by mdc@vixen.uucp
(24104-marden):
+---------------
| I have a 386/33 with 4meg running windows 3.1. I have the
| 1278 set up on COM 3 running at 9600 baud 7 bit, even parity
| and one stop bit.
|
| I have had absolutely no problem running the hardware or software
| *ONCE* I realized that I can't run MULTICOM as a Window but must
| run it in a DOS window
+---------------

Any idea why? I haven't tried it under DESQview yet, because my system
configuration causes the copy protection to have indigestion (translation:
it dislikes my SuperStor drivers; I assume it reacts similarly to Stacker,
or that a later version addresses this --- my 1278 and Multicom are both
somewhat old and MFJ has yet to ship me my updates). But see below.

+---------------
| I also blew the software protection and called MFJ. They were

| both courteous and very helpful. I sent them the original disc
| and they put me back on the air in about 10 work days. There
| was a nominal charge (reload, shipping via UPS and handling).
+---------------

It is claimed that MFJ will send registered Multicom owners a non-copy-
protected version with just a phone call; they encode your callsign into the
copy they send you so they can track pirated copies if necessary.

# # #

It's worth noting that MFJ's support varies from good (above) to nonexistent.
Much like their quality, in fact. And their "free upgrade" certificates
appear to be wastepaper; I haven't heard of anyone actually *receiving* an
update after sending in the certificate.

I think the text from my posting got trashed. Will try to remember
what I said.

Sure would like to hear from Kenwood / PK-232 users about how the
optional filters work on Packet. I am thinking about purchasing
the optional SSB filter for the TS-450S/AT for use on HF packet
with the PK-232MBX. Will the optional filter HELP or HURT Pkt Rx?

>hesitate to reply. So far I haven't received anything, so don't
>hold back!

I haven't used the IC24, but the circuit I use for all Icom HTs
should work. It follows:

```
TNC PTT>---------)))))))------------> MIC tip
                 =======
TNC AF OUT>------)))))))---x
                           |--------> MIC or EAR ring
TNC GND<-------------------x

TNC AF IN<--------------------------< EAR TIP
```

The transformer is a minature 1:1 AF transformer from an old BCB radio
or from a Radio Shack grab bag. You can wire it inline in the cable
and cover it with shrink wrap.

The HF packet survey data was solicited in QST and the RTTY Journal.
But some questions remain:
  1) Which packet magazines were covered?
  2) Was there an ARRL bulletin soliciting data for the survey?

If the answers are NONE and NO, I am disappointed at someone
attempting to say that the survey represented any sort of
cross-section of the amateur community,

I think it's important to tell them what we want and why. Flooding them
with mail is not exactly what I had in mind. But, there are reasons why
it would be beneficial to the packet community to have HF stations be
able to operate unattended... like increased availability to pass traffic.

We need to get as many as possible to write responsible letters telling them
why what they've decided to do is not in the best interest of those of
us who do a lot of packet work.   I've sent a very rational letter of
why I don't like the decision with my own reasons.   I'd encourage
everyone to do the same.

Presley N5VGC

When someone complains and says that I am doing it illegally, I will challenge them to talk to the FCC and explain how they send plain text and hog up the frequency and I compress the messages and spend less time actually on the air and make better use of the frequency. Then what about things like NETROM transmissions, Texnet frames, etc... Those aren't plain text. Does that mean that they are illegal because someone monitoring can't decode it in plain text? NO! If it had to be plain text then we would have nodes lists a mile long on the transmission. I'd have to increase the watchdog timers on the TNC's to transmit all that plain text. I believe that Texnet uses something like 5 bytes of information for it's nodes (any Texnet gurus out there)? How many people even have this information? It was published in one of the ARRL CNC papers a few years back.

If you complain that someone is illegal because you can't easily decode a transmission, do one of the following:

1. Ask the person. If you ask me I will probably invite you over and show you how it all works
2. Determine if they are using the spectrum more efficiently than you are with your non-compressed transmissions.

3. Piece the transmissions back together and decode it yoursel.
4. Get a life!

KAM Data Engine and TCP/IP help?

A Dutch ham working in Nicaragua, Theo Vlaar, PA3CBH/YN1TV, wrote me with a question about packet which is a bit beyond my experience, but I imagine the expertise is out there on the net. Any pointers to archived files or other sources of info would be appreciated. Please e-mail to me at awoodhull@hamp.hampshire.edu

Thanks and 73,
Al Woodhull, N1AW

Subject: MFJ 1278 And MULTICOM.
To: packet-radio@ucsd.edu

>You really can not blame MFJ for the software since they
>sub-contract the work and act only as agents.

MFJ is the contractor and would be responsible for setting the specifications for the contracted software. This would include the user interface, operating systems supported, hardware the software can use and so on.

And it's sold by them under their name.

Subject: MFJ 1278 And MULTICOM.
To: packet-radio@ucsd.edu

As quoted from <1992Aug7.183829.455@porthos.cc.bellcore.com> by mdc@vixen.uucp
 (24104-marden):
+---------------
| I have a 386/33 with 4meg running windows 3.1. I have the
| 1278 set up on COM 3 running at 9600 baud 7 bit, even parity
| and one stop bit.
|
| I have had absolutely no problem running the hardware or software
| *ONCE* I realized that I can't run MULTICOM as a Window but must
| run it in a DOS window
+---------------

Any idea why? I haven't tried it under DESQview yet, because my system
configuration causes the copy protection to have indigestion (translation:
it dislikes my SuperStor drivers; I assume it reacts similarly to Stacker,
or that a later version addresses this --- my 1278 and Multicom are both
somewhat old and MFJ has yet to ship me my updates). But see below.

+---------------
| I also blew the software protection and called MFJ. They were
| both courteous and very helpful. I sent them the original disc
| and they put me back on the air in about 10 work days. There
| was a nominal charge (reload, shipping via UPS and handling).
+---------------

It is claimed that MFJ will send registered Multicom owners a non-copy-
protected version with just a phone call; they encode your callsign into the
copy they send you so they can track pirated copies if necessary.

# # #

It's worth noting that MFJ's support varies from good (above) to nonexistent.
Much like their quality, in fact. And their "free upgrade" certificates
appear to be wastepaper; I haven't heard of anyone actually *receiving* an
update after sending in the certificate.

A little history, this started over in policy about HF forwarding, but it
really belongs here. We've been talking about a VHF/UHF replacement for
the automatic HF forwarding that's about to go away due to the expiration
of the STA and the League's position against automatic forwarding.
Let's take an overview of the packet network so we can see what we should
be designing in terms of protocols and hardware for a robust network to
meet our needs.

Here's a snapshot of where we are.

What are the network uses in order of current importance?

1) Email
2) File transfer
3) Interactive usage

The bulk of packet traffic today is Email forwarding through the BBS
systems. Second is file transfers between individual stations and over

the TCP/IP networks. Last is interactive usage. Currently this is dominated by keyboard to keyboard QSOs, but also includes some remote login activities. Much of the Email traffic is long distance while most file transfers are restricted to LANs and MANs. Keyboard chats occur at the local and regional level with multihop conversations taking extreme patience. Some national and international WAN keyboard chatting occurs on HF. Remote login activities, aside from BBS logins, are mostly restricted to high speed MANs and LANs.

What is the current scope of the network in order of increasing range?

1) In house LAN
2) Urban MAN
3) Regional WAN
4) National WAN
5) International WAN

In house LANs are almost all ethernet based and aren't part of packet radio per se, but are often used to link server systems to systems connected to radio. Urban MANs are duplex bit regenerating repeaters or simplex digipeaters or other simplex node technology. Many of these systems are multiported to allow connectivity to other MANs via trunks. Regional WANs are almost all half duplex node systems, either Netrom, Rose, or Texnet nodes with a considerable number of simple digipeaters still in use. A very few WANs use TCP/IP or multiprotocol switches like those in the GRAPES network. National and International WANs don't exist in a network sense, but there is a system of mail forwarding BBSs operating on HF. This system will soon go away in the US with the ending of the STA.

What hardware methods are currently available?

1) 1200 baud Bell 202 VHF/UHF
2) 300 baud Bell 103 HF
3) 2400 baud VHF/UHF
4) 9600 baud VHF/UHF
5) 19.2 kilobaud UHF
6) 56 kilobaud UHF
7) Experimental systems

By far the most common hardware system is the TNC with Bell 202 1200 baud modem used with ordinary FM voice radios. Second is HF operation with Bell 103 modems through SSB transceivers. Neither of these systems is robust nor do they have good signal to noise or bandwidth performance. Their only claim to fame is that they come standard in TNCs. Kantronics introduced 2400 baud modems into packet. These are used in some systems, but thruput is only marginally better than the more common Bell 202 technology, not twice as good as one might naively expect. That's because turnaround delays and header overhead are a large part of simplex packet. The 2400 baud system will work through standard FM voice radios. Next up is 9600 baud. This was pioneered by K9NG and G3RUH's excellent modem designs. With specially modified voice and data radios, these modems offer

a worthwhile step up in performance. They are not yet in wide use by users, but have found a home in some regional WANs. Another Kantronics introduction is the 19.2 kilobaud direct FSK system. This requires a special radio. A few of these systems are in operation. The last production system is the WA4DSY 56 kilobaud RF modem offered by GRAPES. This system eliminates the bottleneck of voice radios by being both the modem and the radio. It generates and receives RF in the 10 meter band and requires a linear transverter to 222 MHz or higher where such high speed operation is permitted by the FCC. It's in use by users, MAN, and regional WAN systems. Finally we have experimental systems. These range from Clover at HF, to 1 megabit 900 MHz systems, to so called ethernet over microwave systems using Gunnplexers. These all show promise, with the Clover system closest to production.

What major software systems are in use?

1) User terminal programs/TNC firmware
2) Mail concentrator/forwarding BBS systems
3) Karn's TCP/IP

By far the largest number of packet stations are user stations and digipeaters operating off of TNC firmware and terminal emulation programs. The automatic network and user services provided by these systems is extremely limited. Their primary usage is interactive for remote logins and keyboard chatting. A few of these systems now have a rundimentary mailbox built into the firmware. The full featured forwarding BBS systems are next in popularity. They serve nearly every packet user with automatic Email forwarding. Finally we have a true end to end network and user services system, Karn's TCP/IP package. This system features Email, file transfer, remote login, and ordinary chat services in addition to forming part of an end to end network system capable of automated transfer and routing.

What major networking systems are in use?

1) digipeaters
2) Netrom
3) Rose
4) Texnet
5) Karn's TCP/IP

Digipeaters remain at the heart of many rudimentary networks. The horrors of simplex digipeating are well known and I won't repeat them here. Netrom, and it's freeware clone TheNet, are the dominant networking systems in use today. They are firmware ROMs that plug into ordinary TNCs. They feature a semiautomatic routing system and internally use datagram techniques. The primary advantages of this system are that it offers hop by hop acknowledgement and retries if necessary, and that it can automatically configure itself into an existing network. The primary disadvantages are that it's restricted to low performance hardware and that it doesn't offer end to end acknowledgements. Also

it's automatic configuration can create bogus deadend routes. Rose is an up and coming competitor in the low performance networking arena. It is a virtual circuit system that requires manual sysop setup at it's site as well as those of it's neighbors in order to route. It offers hop by hop acknowledgement and retries as necessary like Netrom. In addition, it has slightly less overhead due to the nature of virtual circuits. It's primary disadvantages are that it tears down entire circuit paths when an intermediate node has difficulty, and it is easily overloaded, causing it to drop circuits. It also runs as a ROM on low performance TNCs. Texnet is a medium performance networking system requiring special hardware. It offers a good mix of user services, automatic routing, and medium performance. It's used mainly in Texas, though it has gained adherents in other places. Finally, there is Karn's TCP/IP. It has the potential to do it all. It runs on fairly high performance PC hardware, offers end user services, routing, and network management. It's complex to setup, and is in a constant state of flux as features are added, changed, or fixed. Some versions were very prone to crashing at regular intervals. There are now a few stable versions available that serve very well as network routers. Thanks to it's being based on cheap and relatively high performance PC hardware, it's capable of supporting ethernet and 56 kb high speed links in addition to lower performance links. It's easily multiported, and versions exist that are multiprotocol, interoperating in Netrom networks and digipeater networks as well as pure TCP/IP networks.

Now let's consider the state of the art in amateur packet networking, it's capabilities, and limitations. Our best LAN technology is TCP/IP over ethernet.It's capable of about 60 kilobytes/second transfer and is robust. It meets our needs for Email, file transfer, and interactive usage.

Our best MAN technology in production is TCP/IP full duplex 56 kb repeater systems. This is capable of about 1500 bytes/second. It's usable for Email, file transfer, and interactive usage.

Our best regional WAN technology in use is TCP/IP 56 kilobaud half duplex systems. Thruput is about 300-500 bytes second. It's usable for Email, file transfer, and interactive usage out to between 2 and 4 hops.

Our best national and international WAN technology is 300 baud HF BBS forwarding. It's thruput is about 15 bytes/second. It's suitable for Email.

There's about a 100:1 range spanned here over radio. If we look at typical MANs and WANs, however, we'll find that the performance is even more strikingly dismal. Most MANs still operate at 1200 baud half duplex through a central digipeater. Best case thruput is about 40 bytes/second and typical values are in the 5-10 bytes/second range. WANs are also at 1200 baud, and after 2-4 hops the thruput drops to under 1 byte/second under typical conditions. Now we're talking a 1500:1 range between best and typical thruputs.

If we switched all our systems to the best currently available sytems,
we'd see thruput improvements of hundreds to one over our existing systems.
So why don't we do that? Because of user inertia, cost, and the apparant
complexity of establishing the best systems. The number of packet users
who really understand their new toys is very low. The number of packeteers
who really understand the inherent cooperative nature of packet is vanishingly
small. This latter impacts network establishment, financing, maintainence,
and management. To establish regional and national WANs that interconnect
and interoperate with MANs requires money and manpower to establish and
maintain network nodes in outlying areas. We have great areas of the
country where no, or few, packeteers exist, yet we need those routes to
tie our urban MANs together. Thus we've resorted to automatic forwarding
systems on HF to bridge the gaps, and to wormholes taking advantage of
commercial circuits. A full featured national WAN looks out of reach
to current packeteers.

That's my cut at where and why we are today. Comments?

   I am looking to get into packet radio, and would appreciate it if I could
get some recommendations on a good multimode packet TNC. I have heard some
good things about the PK-232MBX, which seems to be the most-used multimode TNC
around, but the MFJ-1278 seems to have a lot more features.

   I will be doing packet on an Amiga 3000, which has the ability to run both
Macintosh and IBM software, so software compatibility with this Amiga should
not be a problem. I am a beginner when it comes to packet radio, so I would
apreciate it if someone could fill me in on exactly what I would need in
addition to the TNC itself and whatever comes with it (besides the radio).
For instance, the MFJ-1278 seems to require some sort of adapter cable for
each computer, and both the MFJ-1278 and PK-232MBX require specialized software
for Amiga, Mac, or IBM to make use of the really fancy stuff such as SSTV and
FAX.

   Any help with this would be appreciated. For me, the purchase of a TNC is
a rather big expense, so I would like to make sure the TNC that I get will

be the best value for my money, and will also be compatible with other TNCs
in use locally.

  Have you been trying to find the perfect packet radio communications program
for your Macintosh computer? Well, you may have just found it. Virtuoso is a
communications program written specifically for packet radio. This means that
it has features that you as a packet radio operator need and also packs a lot
of bells and whistles to keep your packet radio communications smooth and
effortless. The current version is 1.3.

  Virtuoso is a shareware program with a price tag of only $20. It is
available on America Online, GEnie, CompuServe, and various ftp sites like:

ucsd.edu:
     /hamradio/packet/misc

hpcsos.col.hp.com:
     /packet/ke0ph

pacific.mps.ohio-state.edu:
     /public

sics.se:
     /pub

Some features implemented in Virtuoso v1.3 include:

  -Word Mode - Useful for RTTY and AMTOR.
  -A powerful scripting language to automate routine tasks.
  -Automatic execution of a script when starting and quitting.
  -Save incoming text to a disk file.
  -Send a text file from a disk.
  -Append a selection of text to the end of an existing file.
  -Print a selection of text.
  -Column counter display
  -Word find - useful for finding the last time you heard someone.
  -Spelling checker(Dictionaries Necessary). Checks the words as you type them.
  -Split screen (rx and tx) which can be adjusted easily.
  -Windows can be scrolled up to see previous text (Up to 32000 characters).
  -Full font, size, style, and justification support.
  -Supports 300 - 19200 baud.
  -Keyboard buffer window so you can type in long messages of text
     before they are sent over the air. This window supports full
     cut, copy, paste, clear, and undo like any good text editor
     does. To send the message, just hit Command-Return.
  -Use the control key (or the command key if you don't have a
     control key) to send control characters to the TNC.
  -Option to strip off line-feeds, or all control characters on
     the input before it's displayed on the screen and saved to
     disk. Control-G's can be passed through to beep your computer
     if you want.
  -Virtuoso can automatically put your TNC in KISS mode upon
     shutdown, and take it back out at startup. This is useful for
     TCP/IP'ers.

  This file has been checked for viruses with Disinfectant 2.5.1
before uploading.

  If you cannot find Virtuoso anywhere, send me some e-mail and I'll get
you a copy. I also appreciate any and all comments, suggestions, and
criticism. That's the only way I'm going to know what to fix and improve
for the next versions.

I just bought a DR-1200T at the Austin Summerfest. When I put it in service,
I found that I had to increase my TxDelay from 100ms to 200ms (IC-22U vs
DR-1200T). Does anyone have any data on what "reasonable" TxDelays are for
the DR-1200T??? With the 9600bps mod, it seems quixotic to do so if I have to
spend 200ms keyup for a 15ms packet...

Why can't someone just make a reasonable crystal-controlled radio for packet
that puts out a decent amount of power for a reasonable price? 99.44% of the
"features" of the DR-1200T are useless for us square-wave types. The 22U
is almost perfect. True, it's not crystal-controlled, but it has a damn nice
synthesizer. I'd settle gladly if Icom were to start cranking that baby out
again, set up for packet. It's getting harder to get commercial riceboxes
for conversion, as well as more expensive.
Thanks, I needed that. 8-}

What is the fastest data rate you've seen over "packet"? I have a pair
of Telesystems SLW 900Mhz Spread Spectrum 8 bit PC cards with a packet
driver (for NOS) that has a claimed bit rate of 200kbit/sec. It's only
good for about a mile line of sight, but it is fast.. I was wondering
what others have seen for data rates.. I will summmarize..

I would to speak for the loyal opposition here... I have the
MFJ-1278 multimode tnc and am very, very happy with it. I have
owned the AEA-232MBX as well, and I liked it too, but I found that
it was more complex to set up; I did like the MacRatt software that
came with it, though, for Macintosh use. However... it seems to me
that many beginners buy the MFJ unit and curse it when they run into
problems figuring the many contingencies that must be navigated when
first getting into packet (speed between computer and tnc, speed
between tnc and radio, proper cabling, stop bits, parity, full vs
half duplex, proper Packet mode protocol and use, etc., etc.)...
Getting into Packet is a bit more complex than calling CQ with a
microphone on 10 meters, I don't care what anybody says. And a
beginner is almost guaranteed to have problems, no matter what.
I had horrible, horrible problems with my AEA-232MBX when I first
bought it and was terribly disappointed... until I later found out
that the unit is fine and that my problems had more to do with my

own ignorance than with the unit. That said, I would like to
reiterate that I think the MFJ-1278 is a fine unit, easy to tune,
hardy vis-a-vis pickiness in sensitivity settings, and a good
DX PacketCluster workhorse here at WA4FJF. And... my guess is that
there are more than a few of us out here who swear by the 1278.

I would like to set up a portable packet station for use in my car.
I would like to avoid the cost of purchasing an expensive DC-AC
(cigarette lighter) power converter, and instead downgrade/condition the
power for use directly into the motherboard--no standard PC power
supply needed.

Surely with the countless field day projects and such created though the
years someone has done this already. To save me several days of wheel
re-inventing I would GREATLY appreciate it if someone could point me in the
right direction. Thanks in advance!

Or you could just buy a cheap laptop!
Remember that full-size motherboards require more than just a single 12V DC
supply. They require +-5V DC, at high amperage. I think you would still need
a DC to DC converter, for that. Good luck!

Well, I just ordered an MFJ 1270B, after calling several manufacturers.
It seems that you are looking for an "all-mode", so you would want the 1278.
I am interested in moving up to higher data rates, in the future. Turns out
that the MFJ has true DCD, to sense packets but reject noise, and it has
hardware HDLC, for fast and reliable throughput at higher speeds. It is also
a true TNC-2 clone, and is fully socketed, allowing complete compatibility with
plug-in ROMS and other mods and upgrades from TAPR, etc.

I looked at the Kantronics KPC3, PK88, and PacComm Tiny-2, and they all lacked
one of the above features, although they may have had other features:
KPC3: CMOS, low power, and allows mailbox of up to 512K using standard static
       RAM. Lacks hardware HDLC.
Tiny-2: fast model allows up to 38,400 bps data rate.

It seems that the MFJ is the only one with true DCD.
The MFJ is the cheapest and is known to be reliable. MFJ also claims that
it will operate at a data rate of 19,200, after a simple jumper is installed.
Supposedly, the jumper will be inside future TNCs, and they are sending me
a sheet for the mod.

Ramsey has that little synthesized, diode-programmed radio kit, in the spirit
of the 22U. Might have its own problems, but it's worth asking about, anyway!

Lines: 31

Has anyone attempted packet with a Yaesu FT-2400? I am
interested in bringing this radio into my house and running
packet, but in the manual it states:

"Packet radio operation with the FT-2400H requires a later model
tnc with a PLL-type DCD circuit, since there is no readily
accessible squelch status output from the radio to tell the tnc
when the channel is clear."

The mic output on the unit looks like this:

Pin 1   Call
Pin 2   RX-Audio
Pin 3   PTT
Pin 4   Mic
Pin 5   GND
Pin 6   +5v
Pin 7   Up
Pin 8   Down

Am I totally screwed? Will packet with this radio be next to
impossible? What TNC's would work well with this radio?

Can anyone offer assistance/suggestions/mods/etc?

Sean

Yes, I run a computer in my car all the time. From an inverter. Mine
cost $79 (Tripplite) from the local radio shack and makes 250 watts of 120vac
from 12 volts in. If that is "expensive", then buy the components and
build your own. A 12 volt, 20 amp transformer will work fine in reverse
and a blocking oscillator arrangment will take but a few transistors and
a couple of power resistors. Of course, by the time you get it all
bundled up and isntalled in a cabinet, you'll have more than $79 in it.

As to supplying voltage directly, consider the lowly, humble $30 PC power
supply. It supplies nice, clean regulated power to hundreds or thousands
of dollars worth of motherboard, memory and peripherals. It screens out
nasties that come in from outside and most of the time will sacrifice itself
to large nasties without damaging downstream components. Why would
you want to try to goober up something almost inevitably will do all
the above functions less well and probably at higher cost?

If you don't have the room for a relatively large conventional inverter,
get one of the new whippy little PWM inverters not much larger than a
cigarette pack. They cost, oh, $100 discounted. Still rock bottom cheap
compared to the cost of your homemade 5 volt regulator that decides not to
anymore.

This has been causing problems with my tcp/ip station for almost a year.
December of last year I replaced the XT clone with a true blue IBM PC/AT.
Yeah, an older version, 8 MHz, stacked 2x 256K memory, had to run a
memory card for the extra required to survive the overhead in NOS.

Here's where the noise was coming from: The AFSK port on the DRSI Packet
Adaptor. Type-1 early 1988 version. It took several turns on a Radio Shack
ferrite core to drop the ambient noise level from S9+10 to S3.

>(See 97.113 (d).) Whether or not your local listening station is
>Zip or Stuffit savvy is another question.

A question that needs to be addressed is *why* the FCC has the plain language rule. Originally this was to prevent German *spies* from communicating back to Berlin. Now since amateur operations were *suspended* during both world wars, this restriction is rather moot. The other reason was to stop commercial incursion into amateur channels. Now IMHO that is mostly a moot point as well with the advent of modern communications networks. Few businesses would trust important information to amateur networks. If any *did* setup such a network to interoperate with amateurs, it would benefit the amateur more than the commercial user. Note that encryption *is* legal in commercial service. Again IMHO, this rule should be revisited to see if it's necessary today, if it ever was.

Foreign PTT regulations are different which may preclude use of such techniques in international transmissions to those jurisdictions.

>In any case, there remain no standards for "plain language" in the
>world of compression. What if the FCC van doesn't have a Mac, and I
>transmit a Stuffit file? What about less popular compression formats?
>Compactor? FastBack? Norton? Not all compression software announces
>itself in the header. What would you have to send to make the
>FCC (and foreign PTT if you're DXing) happy?

The current rules only require that a station keep a copy of any non-standard code used in the station records. If the FCC wishes to decompress any message they may have intercepted, they can ask for a copy of the code specification to allow them to do so. They do not require that real time capability to decompress a file be available to them before you can use compression. Foreign administrations' requirements are different.

Marc:
 Name here is Roland Call is 7J1AKI stateside is WF4P.
I run a KAM tnc and have had the MFJ and know folks that
have the 232, as a matter of fact we are running the 232
in my MARS station. I really like my KAM!!
I know the MFJ has some good features and the 232 looks good
but the KAM has the same features plus it is the only dual port
tnc of the three.
The 232 is hard to operate from my standpoint.
I like my KAM. I think I said that....
Look at what you want to do, how much money do you have to spend,
what do you think you may want to do. Then make your decision.

(From G8FSL: home QTH London, UK)
A few of us in London running TCP/IP, using Pac-Comm TNCs in KISS mode,
are having problems with packet collisions.
Even on a quiet frequency with just 2 stations 6 miles apart using a direct
link (link quality to all intents is 100%), one TNC will transmit while
the other station is still sending packets. This naturally slows the link
down enormously.
We've done experiments with frame lengths, persist values, slottimes, and
cannot fix the problem UNLESS we ditch the Pac-Comm code (version E1.1.6D4)
and run G8BPQ KISS code. Unfortunately this means that the TNC cannot be used
for vanilla AX25 use without changing the ROM back.

This problem happens with TNC2 clones running Pac-Comm software, and also
with the TNC-220 (mind you, the TNC-220 has so many problems with KISS mode
{locks up at power on if signal is received during startup sequence, if
configured to use port 1 it switches to port 2 when the first transmit
packet is sent from the computer}). If we use PK-232s there is no problem,
and (as stated above) G8BPQ KISS ROMs work OK in the TNC2s. Unfortunately
G8BPQ TNC220 KISS ROMs don't seem to transmit ... ever!

Is there a known problem in this area, and can anyone suggest a fix
(especially for the TNC-220s, which are gathering dust as a result)?

Data Carrier Detect or DCD in most TNC's is simply a matter of noise detection.

Kantronics KAM version 3.0 and later use a software DCD but you have to select it. (It isn't on as a default) The MFJ-1270b does not have "true" DCD, but a $15 kit from TAPR (exar 2211 DCD) will correct that to allow running the TNC with 'open squelch'. The DRSI cards will work with either thier internal DCD mod from DRSI for about $35. (A nice plug in adaptor that goes in the TCM-3105 socket). TAPR also sells a DCD state machine kit for $20 that work with a wide variety of TNC's and has a xtal osc. that is an option if the X16 clock is not available. (For example when the DCD kit is used with an AM7910 modem chip like that on the Digicom Modems)

Since most VHF packet is done on FM, and most FM stations are either there or they aren't, simple 'is there noise present' DCD works. Unfortunately it also thinks the channel is busy when it hears music, voices, intermods etc.

The trick to HF packet is to set the receive audio level so that the background noise just barely get the (stupid) DCD circuitry to flicker and then back off a bit. Most modems (VHF included), unlike adolescent music, work best at low audio levels.

There might be a software problem. The Pac-Comm I received this morning indicated a lot of EPROM changes on a sheet. I will bring it to work in the morning and see if I can see what might be the changes. They were June of 92 software updates. It also indicated something about FULLDUP in Kiss Mode but I just scanned it before taking the unit home this morning.

Hello,

I'm using KA9q as a slip host. Now i have a connection to the ethernet.
Now i was wondering if its possible to route the slip packets to the ethernet. Is this possible
with ka9q?

Thanks Michel

It's happening on quite a regular basis. And not so far from you, either.

Check out the QST Public Service column, by ARRL Division Director
(and sat-fan-atic) Bill Burden a few months back. It's a nifty
article about how local amateurs are routinely being gatewayed into
the satellites.

>I seem to recall reading in my study guide for the novice test,
>a question about the bandwidth for communicating with an"unspecified
>digital code." What exactly did they mean by this?
>
>jab0684@usl.edu

The FCC uses several methods for relating digital modes to bandwidth. Traditionally they have relied on standard encodings with standard speeds given in WPM and standard FSK shifts. With the rise of other digital encodings, they started talking about "baud rates" in the rules. For example HF packet is limited to 300 baud. Now that's not too satisfactory given that modulation methods other than FSK have appeared. Now bits per second and baud may not mean the same thing as modulation methods have been developed to encode more than one bit per baud, QPSK is an example. So the FCC got down to where the rubber meets the road and said that occupied bandwidth is the only important criteria from a rules standpoint and started specifying maximum bandwidth and letting you fill that with any encoding you like. Unfortunately, they didn't delete the older rules at the same time so now we have a confusing mismash of conflicting rules on what and what isn't legal.

There's also confusion between bit encodings at the machine level, Baudot, ASCII, EBDIC, etc, and bit encodings at the modem level, FSK, PSK, QPSK, MSK, etc. Because the FCC didn't seem to have a really good grasp of the fundamentals involved, their early rules are anachronisms. This is an area of the rules that needs revisiting.

+12 volts isn't that hard since the PC only uses it for drives and RS232.
Getting the +5 volts at the currents demanded, however, is more difficult
to achieve efficiently, requiring a switcher. Negative 12 volts definitely
requires a DC-DC converter. Regulating +12 volts from a 12.5 volt supply can
be tricky as well. There's very little margin to work with, again a switcher
is called for.

Probably the best course is to modify a standard PC power supply. It's
already a switcher. There are a few PC supplies with integral UPS
capability that can run directly from +12 volts. Others would require
some component juggling to run off 12 volts instead of 110. No PC
supply that I know of cares if it's input voltage is AC or DC, and
most are really tolerant of wide input voltage swings.

Having received a few initital reports on the
1992 Perseids from Aug 11/12 I have one further request for observers.
There is a possiblity that something unusual took place in the hours
before the predicted new maxima at 22-23 UT, Aug 11. If anyone made some radio
observations or visual observations in the interval 15-21 UT, Aug 11 I would
be extremely appreciative of receiving a report to clarify the situation
during those hours.

every network has a *different* correct form of addressing, and several of
them are hierarchical.

1) Internet domain names are heirarchical, and are of the form:

```
      local.part%more#local.part@sub.subdomain.domain.name
     \____________  ___________/|\_________  ____________/
                  \/            |          \/
             local part       at       fully qualified domain name
```

the local part can be almost unbelievably complex.

the fully qualified domain name part consists of two sub parts. the end part
(here "domain.name") is allocated by the Network Information Center uopn
meeting certain requirements. the early part ("sub.subdomain") is
handed out by the domain administrator. There is a ham radio domain,
"ampr.org" administered by Brian Kantor (brian@ucsd.edu). He could issue
the name kf7xm.ampr.org to me if he wished. I, being the administrator of the
uvcc.edu domain could issue myself kf7xm.uvcc.edu.

This is more fully described in the RFC's available from nisc@nisc.sri.com
try RFC 920, 974, 1032, 1033, 1034, & 1035.

The PC uses +5V, -5V, +12V and -12V as I recall.

+5 is no problem if you don't mind wasting a lot of power in the 5V
regulator. You'll need a large heat sink. You could also build
a simple buck converter (switcher) to regulate more efficiently.

+12 is used for the disc drives and serial interface. Use a low-
dropout type regulator from the car battery (about +13V).

-12 V is normally only used for the serial interface. A low-current
DC-DC converter IC should suffice.

I think -5V is not normally used. You can probably leave it out.

I strongly agree with the recommendations to just buy an inverter.
Commercial 12VDC-120VAC inverters have gotten very small, light and
efficient in the past decade, and they're not all *that* expensive
either.

You left out the Internet backbone links, sometimes referred to as
"wormholes". There are quite a few regional TCP/IP networks that are
linked to each other through the regular Internet, using IP-inside-IP
encapsulation techniques that have been in KA9Q NOS well over a year.
With the growth of the Internet it is not hard at all to find at least

one site in a given metropolitan area that has both access to the Internet and a ham contact interested in putting up a gateway.

These links provide continuous real-time wide area connectivity that at the moment simply isn't attainable in any other way. The only amateur-provided links that could even come close to providing a similar grade of service require a geostationary amateur satellite such as AMSAT Phase IV, which has been shelved indefinitely due to lack of funds.

I see no reason to deprecate a long-haul linking technology just because it's not radio. Hams ought to take a "systems integration" approach to networking and be as flexible as possible in using whatever is available to get the job done. Personally, I've always thought that the packet radio problems most worth solving are those involved in building high metropolitan area networks, where radio makes the most sense in the first place. Long-haul HF is basically an anachronism, and except for its potential last-ditch emergency uses it is really a dead-end technology.

The NCR Wavelan cards run at 2Mb/s in the 902-928 MHz band. Don't know what they actually attain in average throughput though.

I assembled their 70cm version last month. Despite a long weekend with
a spectrum analyzer, I could not tame the transmitter to my
satisfaction. Lots of low-frequency parasitics, and plenty of phase
noise too.

One of these years I'll stop thinking that the next cheap radio kit to
hit the market will be better than the last one...I wasted money on a
couple of Hamtronics FM-5s, too...

This may be true in the US and other developed countries, but the
situation is not necessarily the same everywhere. In many third world
countries the infrastructure is not there to support reliable data
communications by landline, even locally.

I particularly know the situation in Nicaragua. When I was working
there in late 1990 it was almost impossible to use a landline modem at
1200 baud on my suburban Managua telephone line. Between the two
campuses of the Engineering University it was almost impossible to make
voice telephone calls because of the lack of trunks between two
exchanges in the same city. Landline connections between cities,
especially between the Atlantic and Pacific coasts or between the
capital and mining centers in the mountains were very difficult to
make. International e-mail was available, but exchanges with the US
took place only twice a day.

In this situation the Communications department of the Engineering
University is very interested in using ham-developed techniques and
equipment, not just to establish UHF links between locations in
Managua, but also to take advantage of reliable daytime ranges of a few
hundred miles in the 7 Mhz part of the spectrum for inter-city
communication and to use higher frequencies for international data
links to colleagues in other countries.

I suspect similar situations exist in other third world countries.
Budget restrictions make ham-type techniques and equipment very
attractive for such applications. In Nicaragua there is also strong
support for ham radio itself; they realize that getting young people
interested in radio can only help to provide the technical skills that
further development of the economy requires.

  Maybe I'm just in a less than optimal mood right now and liable to be
nasty, but why should I send the local FCC EOC a few copies of
my data compression utility? And *why* to the ARRL? Huh? Did I
miss something?

  For once and for all, for crying out loud, it is legal to compress or
enCODE data as long as the goal is not to obscure the data. If this is
difficult to grok, let me simplify: if you aren't intentionally enCRYPTing
the data so as to obscure the meaning, then it is NOT illegal.

  Sheesh. What should we do, apply to the ARRL for permission to try
our new data compression scheme out, before applying to the FCC to
insure the overworked staff there is even more overworked reading our
petty request to do something which is legal already? Or do we just read
the damn rules in Part 97 ourselves and act like sentient creatures?

>If you are keeping it propritary, maybe you should reconsider why you are
>using on the ham bands.

  Good point, but where was the implication in the first place that
this was some proprietary scheme?

I see no reason to do even this much. If somebody asks, give it to them.
But don't bother the FCC otherwise.

Our local Packet group has expressed some interest in developing
a gateway on one of our nodes to Amateur Satellites. I have heard
mention of one in Northeastern Canada, and would like some direction
on "where to look" for suggestions, comments, etc. Is PACSAT and
some of the low orbit datasats the way to go? I believe AO-13
is a bit expensive and complex for our organization to go with.
We are really going from the ground floor on this one, but believe
that it could be an real enticement for membership level and activity.
We had a project building modems for Baycom software last year, and passed
one-hundred on units distributed locally. The interest is there -
I just wonder if we can evolve a plan in the next 4 or five weeks.
Thanks for any help. 73 de Carty KA2Y

Greetings:

DISCLAIMER: I have just become interested in packet & radio in the past few weeks.
I have NO licencse (study under way :-)).

I too am looking for FAQs (Frequently Asked Question list) related to HAM radio or, particularly, Packet. I was surprised not to find them on ucsd.edu (did I miss
them?) since they are fairly common on the Internet. Are they kept on a another
server?

Questions:

1) I am interested in transfer rate greater the 1200 BPS. I saw a mail note that mentioned 56K BPS on the 220.55 band. 56K BPS is about what I'm looking for.
Is there a technical reason why 1200 BPS is common (other than historic reasons).

2) Is anyone working on porting NFS onto the current TCP/IP stack? I realize this
may be a resource hog, but, at higher transfer rates it may not be excessive. Any
thoughts?

3) Packet/Internet gateways? Are they common? Is the Internet news feed available through these gateways?

4) Any reccomendations for radios/TNCs. I am leaning toward portable units - the
concept of talking to my home machine (386/33 running OS/2) from a portable or from a Sun workstation is *very* appealing.

As you may have surmised, my background is the computer side of the house. Please

respond directly to me via E-mail unless you feel your note would have general interest.

Heh, heh, the FCC hasn't bought one of the modems yet, though DOC Canada has. BTW I got a look inside an FCC monitoring van. The engineer was really proud of the new PK-232MBX they had just installed.

Legal. The people I've contacted, including those at the League, say
they've never heard of any ruling or policy that precludes encrypted
data.

In particular, the League's never heard of any FCC citation being
issued, and they do seem to keep track of that sort of thing.*

Urban legend.
     - Brian

* Look, the ARRL does do some good things. Their technical and
administrative people are good. It's the political leadership
of the League that needs to be replaced.

Yup. They are on ftp.cs.buffalo.edu under /pub/ham-radio. Brian
Kantor, who manages the ucsd.edu archives, has copies of the FAQ's for
sending via listserv request, so he has them filed somewhere.
Maybe he would consider making them available via FTP at his site as
well (the more sites, the less a chance of a single-point site failure
depriving the net of information).

Maybe you missed something. This was in reference to one you create
for yourself. By sending these copies, it puts the "protocol/format"
sufficiently in the public domain to make it potentially possible for
FCC monitoring to be able to (as if they would care to) "decode" what
you are sending.

> For once and for all, for crying out loud, it is legal to compress or
>enCODE data as long as the goal is not to obscure the data. If this is
>difficult to grok, let me simplify: if you aren't intentionally enCRYPTing
>the data so as to obscure the meaning, then it is NOT illegal.

If you compress in a way you know others cannot uncompress, it has the
effect of enCRYPTing... the uncompress program forms the key.

Making the key public clears the intent of obscuring the meaning.
Sending a copy of a program you create to places like the FCC and
the ARRL would serve that purpose adequately, IMHO.

> Sheesh. What should we do, apply to the ARRL for permission to try
>our new data compression scheme out, before applying to the FCC to
>insure the overworked staff there is even more overworked reading our
>petty request to do something which is legal already? Or do we just read
>the damn rules in Part 97 ourselves and act like sentient creatures?

It's not a form of permission, it is just simply a process of making
what might appear as enCRYPTion to be take otherwise.

Consider if the local OO intercepts your transferred file and tries all
know utilities on it, but all fail because it is of your own design.
So far nothing is wrong, but it is suspect. The FCC might get the matter
next. Actually the OO should contact you first, but in case they don't
at least by having something on file at the FCC, they will know in advance
that things are "cool".

It's intended to just avoid problems, that's all.

If you prefer not to send them a copy, then don't.

>>If you are keeping it propritary, maybe you should reconsider why you are
>>using on the ham bands.

> Good point, but where was the implication in the first place that
>this was some proprietary scheme?

The implication was ONE possibility in the case I replied to about using
a new design (or compression or of anything else). Its should only be
those who plan to keep it proprietary who would not want to make a public
disclosure of the new design. IMHO, proprietary designs have no place
on the ham bands.

I'm sure someone has already done this, but can someone post or
mail me information on how to connect the ICOM 24AT to the
PacComm Handipacket TNC. I have the receive line figured out,
but need to know how to connect the Transmit and PTT lines.

If this information is available by FTP please let me know where,
or reply here or by mail to: mll@math.unm.edu

A problem is how many unattended HF packet operations. The
(widely violated) STA was an effort to see if about 100
could get along, and was not, in my opinion, very successful
in avoiding a lot of QRM and a very low thoughput.
    I doubt if many Extra Class licenses were bought. Maybe
more income means more leisure, or as in Contract Bridge with

the correlation between championship and options trading, a
mysterious correlation between code ability and money-making
ability. Gerry K8EF

I can't imagine the FCC having a filing system that could pull your
unsolicted 'odd-ball' 8-) protocol prior to someone getting around to just
asking you what you're doing. Just who at the FCC should such a notice
go to? Never mind... If I ever do something creative, I'll share with
whoever asks -- and if I notice someone using something new, I'll
just ask them.

How simple can it get?

There is a program that lets you tinker with packet parameters in
order to see what TNC settings have on throughput -- without having
to transmit (it's a simulation program for the PC). It's called
ESTIMATE.ZIP (or .COM in some incarnations). Let me know if you
can't find it on ham BBSs, and I'll send/uupost it as appropriate.

It comes with 'c' source code, too.

Dave

If your compression algorithm is new and different, then publish it
widely in the general amateur media (USENET, PBBSes, ARRL CNC
proceedings, etc) so the rest of us can benefit from it. And if it's
an existing algorithm, you don't need to send it to anybody (including
the FCC) because, by definition, it's already available. And, of
course, if anybody asks, you simply tell them what you're doing.

Geez. Why do people have to make everything so hard?

I've been working 9600 baud (G3RUH) on 70cm with my ICOM 3220 and have good as bad experience with it.

The receiving is FB, it copies packets really nice, but sending really sucks. One thing is that the receiving staitions have hard time in copying it, also the txdelay has to be as high as 20-25 before it starts to work at all. Short packets seems to get through better than long packets.

So, now, I would like to know if there are any good surplus/commersial (mainly surplus) rigs that would work nicely with 9600 baud (txdelay <= 4, good linearity etc) and from where I could get one.

I think it's important that those of us on packet support this effort.
It could change how well HF packet works. FYI

In accordance with the following message from the Net Manager of the
ARRL STA network now operating on 14.098 Mhz. this station will cease
operations for the 24 hour period 0000z August 8 thru 2359z August 9.
I urge all of you to contact your area director and ARRL Headquarters
if you appreciate the relay of messages on the HF networks. If the
present proposal is adopted you can forget long haul message forwarding
as it now exists..

I have seen various posts and articles around refering to a project to
rewrite NET/Mac from scratch for the Macintosh System 7 software. Does
anyone out there know about the status of this project.

I am interested in this since some features of system 7 are not suported
in the current (ported from NOS...) versions.

I agree. The rules are actually clear here - we can transmit whatever
(non-encrytion) codes we wish (meaning ebcdic is legal), as long as
we document them in our log books. Of course, the rules no longer
require log books...

Now, who will be the first to get their 3090's on the air using ebcdic?

:-) :-) :-)

I need some assistance.

I have a Kenwood TM-721 Dual bander (144/440) and a friend of mine has the
TM-621 (144/220) version. Both have been modified successfully to operate
9600 baud packet on the UHF side of the radio (440 and 220). However, the
VHF (144) side of the radio doesn't seem to transmit data correctly. Both
Receive sides of both radios work FINE. In looking at the schematics in the
service manuals, there seems to be a major difference in how the modulation
and loop error voltages are inserted. Has anyone managed to make the 144 MHz
side of the TM-621/721 radios work? Thanks for your help in this.

OK, folks. I am looking for advice:

I am president of the Columbia University Amateur Radio Club, CUARC/W2AEE.
At the past several meetings, we have been bouncing around the idea of
experimenting with TCP/IP. We have a well developed computer system, at
Columbia, and most of the members already have accounts on the Internet.

Some people have suggested that we should create a simple AX25 digipeater node.
But I have been thinking that we would be better to install a gateway to
internet. There are many existing digipeater, in Manhattan. But I don't
think there is a single gateway. A gateway has the potential to create an
instant wormhole to any other gateway, using the Internet as a medium. So,
if I want to chat with my friend in San Antonio, I could do so, with perhaps
3 hops, rather than the impossible 20 or so it might take without a wormhole.

I expect that we should create a simple 1200 bps TCP/IP gateway to internet, to
begin with, since it seems that the club members only have 1200 bps
capability, for now; later on, we could try to get some people on 9600.
We would need a PC, ethernet card, TNC or card, NOS, transceiver, antenna,
local ethernet connection and IP number, and AMPRnet IP number.

I plan to bring these thoughts to Thursday's 6 PM meeting (14th floor, SW
Mudd building, visitors welcome, if you happen to be in the neighborhood).

Several members have already purchased TNCs, but I have been
reluctant, because I wasn't sure which one to get. Several people in the
club are ready to try out TCP/IP. With TCP/IP, higher speeds than 9600 bps
are useful. The three TNCs I have looked at are the KPC3, the PK88, and the
MFJ1270B. Does anyone know whether they can all handle 19,200 bps?

Which TNC or card is best, and why?
Does anyone know who the IP coordinator for Manhattan is?
What is the closest packet-internet gateway to Manhattan?

I would appreciate lots of suggestions and advice concerning this.

Thank you,
Meir Green, N2JPG

Nor do the rules require us to document the codes in our log books.
Refer to Part 97.309(b); one need do nothing special until the
FCC Engineer-in-Charge requests otherwise for the sake of insuring
compliance with the rules.

>It's intended to just avoid problems, that's all.

The road to hell is paved with good intentions.

The regulations are clear on the matter of private data formats and protocols: stations using these where permitted are to maintain documentation with their station records.

There is no requirement that documentation be published. To do so accomplishes nothing with regard to compliance with the regulations. The issue of knowledge transfer is extrinsic to legal compliance.

There is no provision for filing such documentation with the FCC in the Amateur Radio Service, either centrally or, as Phil previously suggested, with Field Engineering offices.

When a regulation is clear, it is legally unsound for action to comply with that regulation, to exceed the action prescribed by the regulator. The enforcement and adjudicative structures in place provide for dealing with a problem after the fact, on the sound basis that before the fact, there is no problem.

Far from avoiding problems, Phil's suggestion would create them, if in no other way than by inducing work that present regulations were designed expressly to avoid, and which as a matter of public policy, we can ill afford.

Hi Packeteers!

I'm having trouble getting my PacComm Handipacket TNC to work with my new ICOM 24-AT handheld. Neither ICOM or PacComm gives very much info on interfacing the TNC to the radio. The TNC is nice in that it provides and internal 2.7k resitor on the PTT line, but that doesn't seem to be enough. I added a 1k resistor in series with this, but still no luck. My problem is that when I connect the radio to the TNC, the radio is continously keyed up and the DCD light on the TNC stays on also. I've connected each line up independently of the other without luck also. Before I had the radio, I had the TNC hooked to a voice pager where I could monitor packets without trouble, but now that I'm trying to use the Mic/PTT, nothing works. I've ohm'd out the cable and it doesn't appear to be shorted.

I am really anxious to get this to work. I'd like to hear from anyone who has experience with hooking up a TNC to the IC-24AT handheld or the PacComm Handipacket TNC. If you can help, don't hesitate to reply. So far I haven't received anything, so don't hold back!

Reply here or mail to: mll@math.unm.edu

Salut, Frederic! TAPR 1.1.7b is available from many places,
including PC.USL.EDU. In fact, if you are going to use KISS
protocol, I recommend you use version 1.1.7b in lieu of ANY
other version, up to and including 1.1.8.

On PC.USL.EDU (130.70.40.3) look for pub/ham/tapr117b.zip.

Bon courage!

Well, that's putting a bit of a spin on it. What was said was that
we hadn't head of any specific action with regard to compressed
files. There is a rule against encryption *for the purpose of obscuring
the meaning* of the data. To that extent, there has been a ruling
precluding encrypted data. There is also a rule that disallows HF
transmissions that aren't ASCII, ITA2 or CCIR 476/625 coded. (I don't
mean to be pedantic, just specific.) Which is not to say that some FCC

field staff member might not have said, "sure, go ahead and send that
data..." But field staff don't make policy, so caveat emptor.

The way to avoid problems is to treat an OO the same here as you would
any other instance. Tell him to pound sand and go away. His wannabe
cop urge will pass after awhile.

John

Hello,
Would somebody post a comparison between these two multimode controllers, please? [The choice is to be made about which one to buy for HF and VHF]

1) Modes (hopefully including relative wide-spread of those mentioned)

2) Features, performance (if applicable :-)

3) Reliability and easiness to use

4) Customer Service

5) Upgrade-ability

Also, where does DSP-1232 (and 2232) fit into this scheme? Yeah, it has great potentials, but to unlock those do I have to program that nice DSP myself? And what advantages does DSP have TODAY? More modes? Any other?

Thanks! Oh, BTW you can e-mail your reply to me as
well.

Regards,
Uri. uri@watson.ibm.com

That would make even more sense. That way there is no doubt that it is
not a secret code.

Noone has replied to my query on which TNCs are capable of running high bit
rates.
Does anyone have the email address of someone at TAPR, who might know?
Does anyone have the phone number for TAPR?
I assume that they can answer my question, since TAPR is involved with high
speed packet modem experimentation.

Thank you.

When using the finger @host command (2.0jGRINOS), the server responds
properly by returning a list of files contained in the finger directory.
However, when issuing finger all@host, NOS returns unknown user. What
can I do to solve this?

Thanks in advance for any assistance!

I have access to a pair of microwave transmitters and receivers. I want to start a project on connecting two computers with ethernet cards in them via the microwave tx/rx.

The information that I need are references to literature and spec's on what is necessary to do to accomplish the connection.

The microwave tx/rx's are:
Micropass II FM Microwave Telecom Link
FCC ID B2N9CL 10050
Part # 10050-100-18 and 10050-216-02
Racon Inc.

I need some sort of information on these tx/rx's.

I have already done research on the FCC regulations on communications via this method and I believe that I should have no problem getting the necessary license to
do so.

The tx/rx's operate in the 22-23GHz range, would it be possible to have ethernet packets and related data be transported across such a link?

Please send me e-mail and thank you for your time.

I am thinking of upgradinging my PACCOM Tiny-2 to 9600, but I know there
are 56k modems out there.

Does anyone know where can I get more information about these modems? How
expensive are they? Do they work with a normal transceiver? Why do people
use 9600 if they can use 56k? Do they still use AX25?

A recent inquiry asked for a comparison of the MFJ 1278 and AEA machine.
I bought the MFJ, as it seemed to have similar features to the AEA 232, and
was a few bucks cheaper. So why not save the 30 bucks or so? I have
the only MFJ TNC in the area, but I wish I would have joined the majority.
I can basically work the machine okay, but have had lots of problems. I
believe most of the problems are in the MFJ software. The software documentation
is inadequate IMHO. I can use LanLink, but then I do not get the multimode
stuff, of course. I recently bought a new computer, and cannot use the
MFJCOM software, the machine locks up with the first keypress. I have a
copy of MULTICOM, but I find it is copy protected. I wanted to use it on
both my portable and my desktop. I have succeeded in wasting the available
copies trying to break the copy protection. In short, the machine works

okay when I can communicate with it, but have had lots of software problems.

Thanks a lot for sharing your experience.

That their firmware is buggy - is bad. That their MULTICOM is
copy-protected - I will NEVER buy their stuff, period. Thanks
for letting me know beforehand.

So it looks like the only way is AEA...

Regards,
Uri.

Howdy!

Does anyone out there have experience running Baycom on an AT&T 6300pc, or
any other 8086 machine.

I'd like to get into TNC'less packet, however, Poor Man's Packet author Andy
Payne has told me that his software will not run on my machine.

Any other ideas?

Thanks,

I have an MFJ 1278 operating under MULTICOM. I noticed the thread
regarding problems with the software and the hardware.

I have a 386/33 with 4meg running windows 3.1. I have the
1278 set up on COM 3 running at 9600 baud 7 bit, even parity
and one stop bit.

I have had absolutely no problem running the hardware or software
ONCE I realized that I can't run MULTICOM as a Window but must
run it in a DOS window

I run SSTV, HF and VHF packet, RTTY, CW and AMTOR. A couple of
us are experimenting with RTTY over VHF FM (2 METERS).

I also blew the software protection and called MFJ. They were
both courteous and very helpful. I sent them the original disc
and they put me back on the air in about 10 work days. There
was a nominal charge (reload, shipping via UPS and handling).

You really can not blame MFJ for the software since they
sub-contract the work and act only as agents.

All standard disclaimers should be applied at this point.

I think we should all write to our ARRL rep and let them know how po'd we are about
the whole thing, however, I don't think that making all the users of the BBS's suffer
for a poor decission that some schmuck (or schmucks) made is the right way to go about it.
Flood the sobs with mail and what ever else you can think about but don't jump on
their sewer-level bandwagon and do basically just what they are proposing to do,
which is screw the user community.

I think the days of throwing tantrums and doing the old "we'll showem who kicks the
most" bs are over, flood the suckers with mail and tell them that if they don't
look after our needs, which is what they are supposed to do, we will just fire them!

Holy Cow! You paid perfectly good money for a program, something went
wrong with something you don't use anyway (copy protection), you were
off the air for 10 days, and you had to pay more money to get things
fixed! I could sell you a junk car, you still wouldn't be able to drive
it, but send me more money, and I'll give you a car that works. This the
rotten attitude of a bad software company. I agree with other folks
who get excited when someone tells 'em that something is copy protected
and they won't buy it. If the copy protection causes you any trouble, they
ought to overnight the fixed version to you AT NO CHARGE!!! You are honest
the copy protection only gets in your way.

Sorry for posting to the net, but I can not seem to reach Jeff Angus thru email :-
(

Hello Jeff,

Could you tell me what you did?

I have a TM-721A and I would love to put it up on 9600 baud, even if it is ONLY UHF for now.

After I have the UHF going I will be, like you, wanted and working to get VHF working at 9600 baud.

If you get info on how to make it work at 9600 baud for the VHF band, let me know... I am very interested.

Thanks in advance.

P.S. What values are you using for TXDelay?

> The people I've contacted, including those at the League, say
> they've never heard of any ruling or policy that precludes encrypted
> data.

I think you meant *compressed* data. *Encrypted* data is a no-no.
Now that cheap compressing software incorporates pretty good
encryption algorithms, we'll have to be careful.

The thing which the FCC is concerned about, it seems to me, is whether or not the ham is trying to obscure the meaning of the transmission. (See 97.113 (d).) Whether or not your local listening station is Zip or Stuffit savvy is another question.

An Amateur Affiliate coordinator spoke at a club meeting in Boston about a year ago. He told us about an incident in which local hams exchanging ZIP files were contacted by the FCC and asked to explain why they were transmitting in cypher. I may remember the story wrong--it may have been a zealous but uninformed Amateur Auxiliary who got upset, I don't know.

In any case, there remain no standards for "plain language" in the world of compression. What if the FCC van doesn't have a Mac, and I transmit a Stuffit file? What about less popular compression formats? Compactor? FastBack? Norton? Not all compression software announces itself in the header. What would you have to send to make the FCC (and foreign PTT if you're DXing) happy?

I've just heard some of the basics about packet radio, and I have some questions. If there is a FAQ that answers these questions, then just ignore this post and I'll get the FAQ when it comes along.

1 - How much does it cost to get a basic transciever that will connect to my computer?

2 - Can I get a tranceiver that will pretend that it's a telephone so that I can use my current modem?

3 - Once I have the equipment, how do I go about "getting connected?" Do I have to register in my area or just go online? (Admittedly not very likely.)

4 - What types of communications protocols are used? What is KA9Q, and is
    it THE protocol?

> 1 - How much does it cost to get a basic transciever that will connect to my
>   computer?

Depend on if you buy new or used. Certainly under $300.

> 2 - Can I get a tranceiver that will pretend that it's a telephone so that I
>   can use my current modem?

No, the modem that you have will probably not deal with the nature of
the radio. Amateur radio transceivers are not full duplex devices and
need to be told when to transmit and when to receive. There are
however some very cheap packet modems that use the smarts of the
computer, though the traditional way is to use a TNC which looks like
a modem but contains a Z80 inside that does some of the protocol and
other housekeeping for you.

> 3 - Once I have the equipment, how do I go about "getting connected?" Do I
>   have to register in my area or just go online? (Admittedly not very
>   likely.)

We don't need no stinking registration. You just connect like you
were dialing up a BBS (Ok, so maybe it's a little more involved than
that). The individual BBS's may require setup, but it's totally
analagous to telephone bbs. You do need to get a license, but with
the elimination of the morse code requirement, this is just a
formality.

> 4 - What types of communications protocols are used? What is KA9Q, and is
>   it THE protocol?

The underlying protocol is AX.25 (which is as it sounds, a variation
on X.25). This can be used by itself or in conjunction with other
protocols. Most user -> system interaction is still exclusively X.25,
though some people use TCP/IP. The routing infrastructure typically
uses another protocol of which there are a few in use.

KA9Q is the amateur radio callsign of Phil Karn. It is used to refer
to his network program for the PC, originally done to allow TCP/IP
to be used with packet radio. However, the later version of the code
includes an operating system called "NOS" that provides a multitasking
environment helpful in network hacking so KA9Q supports all kinds of
things now.

Well if you are *REALLY* that worried about bandwidth, why post this, why not
EMail it :-)

Sorry if I offended *YOU* by positing somthing to this group, somthing I thought might be usefull. Well to me anyway *IF* I get any feedback. However, this is a low volume group, and larger things are regularly posted onto other groups that are far busier. Maybe this is why :-)

Thanks to the others who also posted replies to this message in my support. Although I don't consider myself a newbie (just don't post enough ;-), naive, OK I'll admit to that.

Paul

This is a difficult question to answer. If you only want to do standard RTTY, AMTOR, HF and VHF packet, then go with one of the more traditional units such as the PK-232MBX. The DSP units provide a multitude of other functions and are capable of doing much more than they already are doing. The scope of their capabilities at this time are limited only by the imagination and energy of the software writers and the rate at which the DSP executes instructions and we are just barely beginning to see that edge as we construct some really fancy algorithms to run on them. As to which is best, this is also complicated. If what you care about is getting the best modems, then ask for opinions on which of the two DSP

multimodes has the best modems and you will get opinions on that from
many people and you will have to filter the response based on the
usage, mode, etc. and see whether or not it impacts the way you want to
use the unit. If you care about tinkering around inside the units,
the LL Grace unit, with a couple of hundred dollar addition which includes
memory upgrade and a license and copy of the source code (NOT DSP source,
host source) comes with it. Both units support the uploading of modems
and I know that AEA is very actively pursuing the construction of new modems
since I am writing them. At this time, if you care about doing RTTY/AMTOR
Baudot and HF packet with the unit and also wish to pay for the ability
to do fancier and greater things later (many now, more later) this suite
of modems has been extensively tested and the AEA modems for RTTY/AMTPR
and HF packet are demonstrably better. The LL Grace unit can be easily
upgraded with new software to provide better modems and I can only assume
that this is being pursued but I think your question is about now and not
what might be. Both of these units have a large suite of modems to support
satellites. There are two versions of the AEA box, one which is capable
of running two modems at once whilst hooked to two different radios (AEA
is shipping these ROMS now or will be shortly, they are not waiting on
me). The cost, support available, etc. all should be factors in your
decision. As I have already stated, as this is just a quick note jotted
down at lunchtime here and you can see that I have given a lengthy reply
which may or may not be an answer to your question, this is a complicated
question and more is needed from you on how you intend using this stuff.

Bob

Subject: Status of BayCom?

I just started experimenting with packet and BayCom again after a lapse
of many months. I obtained BayCom version 1.50a a while ago and it seems
to have a lot of improvements over versions 1.2 and 1.4 which I had used
in the past. I've also upgraded my system substantially, and can now
run BayCom on a 486 with 4M of memory; I also have Windows 3.1 and OS/2
version 2.0.

I have several questions for anyone on the net who might know:

1. Is version 1.50a the latest version available?
2. Is printed documentation available in English for dollars from
   somewhere in the US?
3. Are there any ways to make BayCom take advantage of extra memory
   so I might have room to run larger applications from the OS Shell?
4. Has anyone experimented with BayCom under Windows or OS/2?
5. On one occasion my system crashed with graphic characters in the
   prompt and unresponsive even to ctrl-alt-del upon exiting from a
   long BayCom session. I think it happened during execution of the
   OFF command; all the SCC files were saved properly before the crash.
   Does anyone have experience with this kind of thing or ideas about
   what happened?
6. Is there any mailing list or archive site where I can find other
   info about BayCom?

For years I have been wondering how I was going to get my PK232MBX, my Totalham logging program, my Kenwood TS-940, my mouse, and my modem all working at the same time. The solution came in the form of responses to a post that I put out asking:

How do you overcome the IRQ3 and IRQ4 conflict problem when using com1,2, 3, and 4?

The solution came from a sysop in Canada.

For those of you who want a similar setup you must:

1. Use a bus mouse - this poses no conflict.
2. With you first serial card (COM1 and COM2), hook up the two devices that you normally would use with the exception of the mouse (it is taken care of on the dedicated bus). COM1 and COM2 are usually configurable for IRQ4 and IRQ3 respectively. The problem arises when you purchase your next inexpensive serial card that will configure COM3 and COM4, but again uses IRQ4 and IRQ3 respectively. Here comes the tricky part.
3. KEEP THE PAPERWORK that comes with the card. You will have to hardwire IRQ3 line to the IRQ5 pin on the card, and hardwire the IRQ4 line to the IRQ2 pin on the card. Once you have done this you can hookup your PK232 and your radio to COM3 and COM4 with no conflicts. Note the the jumper settings for IRQ3 or 4 are now IRQ5 or 2.

This solution worked for me. I am using an 80386DX with 8megs of ram running at 25mhz. All applications; ProComm Plus 2.0 (accessing com1), Lan-Link (accessing Com2), my Kenwood Control program (accessing Com3). I plan to use another com program dedicated to packet on Com4 - this way I can use RTTY, AMTOR, CW or any of the other digital modes through COM1 connected to the 940, and stay connected to the DX packet cluster on COM4.

If you are unfamiliar with any of the above procedures, check with a technician before you do them. I will not be responsible if this dosn't work for you. (SORRY - HAVE TO PUT A DISCLAIMER).

Good luck for those of you that try this, and if anyone has any other solutions please send them to me. I have other lists that I post to, and I'm sure others would like the knowledge.

this may belong in .policy, but since there are also technical concerns,
I'll start here.

let's say someone wanted to setup something on packet (more likely on
HF packet) to use data compression between two stations. note, I did
NOT say encryption....just data compression.

first, would this be legal? my immediate guess is that it would be,
but that it's probably worth asking the question.

second, there are obviously lots of technical concerns. the type of
system I'm kinda thinking about would be an error-control/data compression
scheme very much like that used with modems (V.42/V.42bis, for example).
naturally, it isn't as simple as that with packet, but....

assuming that everything uses KISS, and that it is possible to enforce
the block size/PACLEN settings such that no data block ever gets split
into two packets, does this sound like a good thing?

of course, if you don't split the data block between packets, you really
don't need extra error control...just something to make sure that packets
don't get lost somewhere along the way. QUESTION: AX.25 already does
this this, right?

next question: does anyone know where I could find a very good, very detailed description of the KISS protocol? how about AX.25? (or can I just get the specs for X.25 and then get some diffs?)

any info appreciated....

Summary:

Given the arguments made in the report by the ARRL Committee on Amateur Radio Digital Communications, an estimation of the needs of the autoforwarding BBS community, and an understanding of the technical state of the art, the concept of unattended HF automatic forwarding should be reconsidered. The following are suggestions in this regard.

1. A 10 kHz allocation, channelized initially at 500 kHz.

A typical BBS net operation today requires the passage of about 100 1KB messages per day. Allowing a growth factor of 10, this represents about 1MB, or 8Mb of throughput per day, or about 97 bits per second per link. Simple compression techniques (for example, fixed Huffman compression)

can reduce this to less than 51 bits per second.

This is certainly attainable today given better HF packet implementations and operational practices, and is more than attainable with future systems, especially CLOVER.

A 10 kHz allocation represents 20 basic forwarding channels using frequency multiplexing. Proper allocation and power management should result in doubling this figure to 40 links. Future transmission improvements will allow more links to be added using time division muliplexing.

2. Allocations on the 12, 17, and 30m bands.

The Committee's report indicated considerable opposition to unattended operation in the 20 and 40 meter bands. This opposition is understandable, given both the history of the bands and the nature of the existing unattended operations. 20 and 40 meters have existed as amateur bands for decades, and as a result, a considerable degree of inertia exists. Given the relatively uncoordinated nature of the existing STA operation, many of the established operations, especially on 20m, experienced an unwelcome intrusion upon well established practices.

In contrast, the new "WARC" bands have only existed for about a decade. Regular operational patterns have yet to be established, and the bands are much less populated. A special allocation of 10 kHz in each band would have minimal impact on users of other modes. Clearly, the "new" spectrum of the WARC bands should reflect new usage and new modes. Such an allocation would allow a link to follow the Optimal Frequency throughout the daily cycle.

3. 100w output power to a 10dbi or greater directive antenna.

In keeping with considerations made in point (1) above, output power from the transmitter should be limited to less than 100w. To limit the spatial coverage of the channel, at least 10dbi of antenna directivity should be required.

4. Unattended HF autoforwarding by Extra Class Licensees only.

Given the history of existing HF packet operations, it becomes very clear that operator mistakes are largely responsible for the poor throughput of existing HF packet operations. While Extra Class Licensees are not perfect, they do represent a group of operators who have shown a willingness to study the radio art beyond the average operator. Moreover, some means of limiting eligible operators is necessary, given the limited number of channels.

5. A coordinated operation has precedence over an uncoordinated operation.

The actual allocation of channels to operators is similar to that for FM repeaters. While the existing system of coordination is far from perfect, it is preferable to having the FCC coordinate the allocation.

These are the basic proposals that need to be codified into Part 97. This

necessarily leaves a number of issues open to be setted by the community
of HF autoforwarding operators, especially coordination. The reason for
doing so lies in allowing the state of the art to determine the actual
operation, rather than the state of the law.

I wonder if somebody has come up with something analogous to the BayComm idea
for the Mac -- that is, make up a simple modem for your serial port, and let
the computer do the TNC emulating work.

Idea: all the TCP/IP software is available in a Mac version. It expects a
TNC in KISS mode. Can one come up with a cheap KISS-only modem in some way?

Any ideas along this line would be appreciated.

Hello dear packetter,

I found TAPR118 in UCSD.EDU .
I use a clone release 1.1.6 for now.

Question : Where can i found TAPR116, TAPR117 (and clone) ?

It is because i have not all documents to use it, especially
SLOT commands, and other.

Many thanks to answer me.

SoftKiss is an init/cdev/driver that drives a ham radio
modem from a macintosh. It gets your mac on packet radio
without a tnc. Softkiss can use poor mans packet modems
from the IBMPC world. This is version 1.2.1. The previous
version was an application which required multifinder. This
version is an init/cdev/driver that can run under finder or
multifinder on any mac system 6.x or 7.x.

Softkiss is available from internet host akutaktak.andrew.cmu.edu
[128.2.35.1] as /aw0g/softkiss.1.2.1.hqx. It is also on compuserv
hamnet sig lib 9

NET/Mac is also required. It is available from the same archives.

I am sorry for the cross-post, but this is as close as I can get.

I know that there is a newsgroup called rec.radio.amateur.marketplace (or
something similar), but I can not get to it from my location. Could
someone please dump all the postings to a file and E-mail it to me just
one time? I want to buy a used HF radio at a hamfest in 2 weeks, and need
an idea on what used prices are like. Alternately, is there a site where
I could 'anonymous ftp' recent postings?

Please E-Mail if you can help (to prevent several people from doing the
same task).

Thanks in advance,
Mark (N5XYV)

Restricting auto-forwarding to Extra class licensees is silly. We've
just managed to eliminate CW elitism on VHF and now we're trying to
reinstate it on HF.

There is no significant correlation between license class and operating
ability.*

If Paul means this as a conciliatory sop to the entrenched die-hards, he
should say so.

     - Brian

*I was once told that there IS a significant correlation between license
class and income. Fraud (i.e., purchased licenses) can't be the major
reason; I wonder what is?

Given the limited number of channels, the only allocation scheme that seems
fair is to limit it to Extras. If you have a better idea, please say so.

>If Paul means this as a conciliatory sop to the entrenched die-hards, he

Not likely.

>*I was once told that there IS a significant correlation between license

If in fact this is true, it's another argument in favor of the restriction.
People involved in this operation by definition need to stay at the
leading edge of the state of the art, which is uncheap.

To : All of those who hate, like, love the ARRL.

As many will tell you it is a very rare occasion for me to "take
pen in hand" and post something to the net.

I have been following all the "chit-chat" regarding: 1.) Ohio
protesting, 2.) AMSAT is better than the ARRL, 3.) ARRL is
better than AMSAT, 4.) HF packet, 5.) non-HF packet, 6.) etc.

I am a member of ARRL but I find it of little value to me. I keep
my membership because I do not know of any other organization
with the "clout" in Washington that the ARRL does. I feel that
if I ask someone to do something for me (use their "clout" for me
in Washington) I should be willing to aid them financially or some
other way. So I say to you "ARRL bashers" until something better
comes along swallow your pride and work within the limitations
of what you have. I do not think I would like to have my company
represented by the "good old boy" psychology that "the nine old

men of Newington" (anybody remember FDR these days) have but I guess
it would be better than no representation.

To me QST is a catalog of advertising. Since I am arthritic
and also a business person and (without any derogation) not an EE.
Trying to wind 4000 turns of number 40 wire on a T-5000 core with
taps every 15 turns is not only impossible but leaves me cold. Why
can't we have more on the fun of Hamming and less on the projects
for the homebrewer. I take my hat off to the people that design
these things and do it doubly for those that build them and make
them work. You may say "why don't you write an article or story."
Believe me my wife is still laughing at my latest attempt at that
and it has been five years now.

I disagree with the ARRL on their approach on packet on HF. I
agree 1000% that when they bring up W1AW they should not be
required to check each frequency to see if it is clear. In both
cases I have let my feelings be know.

This may be the ramblings of a 65 year old advanced amateur who
enjoys packet, AMTOR, RTTY; loves to rag chew and *ESPECIALLY*
loves CW, *BUT* for the life of me can not understand Newingtons
hang up on 13, and 20 words of CW per minute to be able to
upgrade. I guess it is the "I know it is modern times with
computers, TNCs, ROBOTS, etc. but I suffered to get my upgrade
and I will not hold still for you not suffering like I did".
GOD HELP US ALL.

I assume this will generate some flame, but so be it. The only
thing I ask is send it via e-mail since the net is cluttered
up enough now.

73s for all the guys and 88s to all the gals. (Sexist remark
acknowledged.)
All standard disclaimers should be applied at this point.

It's a little more than a formality, we hope. The morse code
requirement was the formality, and the exams try to keep you
within the law and ask you to know a little about radio.
Get in touch with a local ham (radio amateur), and GL (Good Luck),
and 73 (Best Regards) K8EF@W8CQK.OH.USA.NA

Who has been able to install a Packet-Radio program like NET or NOS
on a minicomputer like a HP1000 ?

Please if someone did, contact me.

Regards, Wim

Thanks to everybody for the information I asked about. Yes, the article
appeared in 73, August 91.

Also, 73 is having information specifically about Macs, SoftKiss, and a
cheap hookup in their upcoming October issue. Should be good.

Once again, thanks for the many replies!

  This is probably an FAQ, but I didn't see a copy of it in the unexpired messages for this group on my site....

  I need to know what the latest version of the KA9Q TCP/IP software is, and where I can get a copy of it.
  Please respond via e-mail. I'll see that sooner than a message in the newsgroup; and there's no point in using up all the bandwidth just for me.. :)

   Thanks,

      Monte Freeman - KC4GPW

Hi, Please excuse me if this is a FAQ:

I have a friend who is interested in packet radio and has three KayPro
computers cluttering up his garage. Is there any packet software that
anyone knows of that will run on a KayPro? It would put at least one
of those rigs to use and get another packet'er on the air.

Thanks in advance for your time!

 Hello,
   I am looking for any and all MS-DOS based software that will analyze a
 normal ax25 packet frequency. I am intereseted in keeping track of the
 stations that use the frequency and an analasis of the stations usage
 per period of time, be it hours, days or whatever. Please let me know
 if there is anything I can FTP, download or send away for.
   Thanx!!!

I don't happen to know any ham operators. I'd like to get my computer up
on packet radio, but I really have no idea about how to do it. Is there
someone in my area (look at the signature) that would be willing to help
me to get started? (I'm a computer professional, but I don't do radio yet.)
I'd like to start receiving Usenet news via packet radio if that can be done.

By the way, is there a FAQ that I should wait for? If not, I'll be asking
some more beginners questions.

                  Thanks in advance,
                       -=:[VAL]:=-

|John... you asked about a TNC'less interface for packet. Here is a message I
|got from Andy about a program he has done that looks like it might do what
|you need.

Just one note from personal experience. I have a mac plus, and since the
SoftKiss driver re-initializes the serial port, the mouse loses vertical
movement. The author of SK, Aaron, told me Friday that it was due to the
mouse being hooked to the interrupt of the serial chip(s).

Aaron also emailed me and told me he was fixing it soon. So, the bottom
line is that if you have a mac plus, you'll have to wait.

Also, the most recent version was 1.2, if I remember correctly.

     I tried mailing a reply, but it bounced. Looking at the path, I
can see why. So here for everyone is my reply:

There is such a programme. Written by Harold Price, NK6K and Skip Hansen, WB6YMH.

You can find it on Skip's BBS at (310) 541-2503

Sorry I can't remember the name. The BBS does have search utilities though that should help you find it. Somehow PACKET MON rings a bell.

Yours

I am glad to see that after all the rhetoric, that we are finally
getting down to some concrete proposals.

There seem to be some real fears of automatic operation "taking
over." I don't think unrestricted automatic operation will
be permitted.

My personal thinking is that we should keep the ARRL proposal as is
and simply tack on an sub-band for automatic operation.

>handed us the 500 Hz figure.

Assuming a single-tone system, sure. But most of the proposals I've heard
for improved HF modem technology use multitone systems. If you want to get
lots of bits through between point A and point B on a fading channel, one
way to do it is to use multiple tones at low baud rates. Such a system
might well occupy a channel of greated than 500 Hz. Of course, you might
argue that such a station is using multiple channels, but I think to the
FCC a "channel" is that band of frequencies occupied by a station,
regardless of the niceties of the modem scheme.

>(or whatever source) produces 10 1kB messages per day, with 50% compression,
>one third capacity represents about 30 message sources.

Seems like a reasonable basis on which to base a number. Of course,
advances in technology might mean that a N=30 station wouldn't keep the
channel filled, but that seems like a small concern.

>>3. "Semiautomatic." Maybe we should keep this part of the original

>
>This part of the proposal would be good for leaf nodes of a network, which
>don't generate enough traffic to warrant UAA operation.

And for non-network stations, too.

Hi,

I wonder if you can help.

I have a TCPIP station running with 2.0f PA0GRI code and
I would like to autoforward mail messages generated using
elm to the normal vanilla ax25 packet network. I`ll explain
:-

Supposing I wish to send a message to gm4xxx@gb7edn my local
mailbox being gb7san. I want
to be able to specify that as an address in ELM for the SMTP
server to send to my local mail file gb7san.txt in
spool/mail. This would then able me to use the forward.BBS
file to connect to my local F6FBB (gb7san) mailbox and
forward all unread messages in the gb7san.txt file, thus it
would send the message to gm4xxx@gb7edn.

I have tried using the address gm4xxx%gb7edn%gb7san@gm4yed
but the smtp server complains that host gb7san is unknown,
presumably cos it can`t find it in my domain.txt file as it
is`nt a tcpip mailbox. According to the latest version I
have of the maildocs, the alias and rewrite files are not
scanned when using ELM, so I`m stuck unless anyone can
suggest anything???

Thanks in anticipation.

Robin Alexander

I've sent many, many ZIP-compressed files (primarily versions of the NOS source code) over packet radio and never had any inquiries from the FCC. Of course, this was at 56kb on 220.55 (before we lost that part of the band) so there may have been other obstacles to the easy monitoring of my transmissions.

But I never let that stop me -- if somebody ever asks, I'll tell them what I'm doing, but I don't feel I need any special advance permission from anyone to do something just because thousands of other hams aren't doing exactly the same thing. The FTP control channel messages that immediately precede a file transfer and name the file (e.g., NOSSRC.ZIP) ought to be enough to give anybody with nothing better to do than monitor my transmissions a pretty good idea of the file format.

I have enabled a internet to packet gateway on my bbs. I have further extended it to allow internet users to appear to live on the bbs system. Thus doing away with cryptic addressing and allowing those with no packet equipment or no bbs's in their area to participate.

In short it works this way. A packet user wishes to send a message to you. When the white pages are checked it shows you as having your homebbs as N0ARY. When the message arrives at my bbs this address is translated to an email style address and sent through the gate.

Sending messages through the other way is just about as simple. If the person you wish to reach is n6zfj@n6qmy you simply address your message

to n6zfj%n6qmy@bbs.arasmith.com. Notice that the '@' in the packet address is a '%' on the internet side. You can originate bulletins in the same fashion, exams%allcan@bbs.arasmith.com.

To use this service you have to register in advance. My system has to be able to translate your "from" address found in your mail header into your callsign. This means that you will have to always use the same host to originate messages.

If you would like to take advantage of this service just send a message to:

     gateway-request@arasmith.com

with the following information.

     CALL:
     First name:
     City and St:
     Zip:

This information is necessary to fill in your white pages entry on the bbs system. When your registration has been processed I will send you full instructions for using the gateway.

Depending on the demand I may have to limit registration until the system has been fully tested.

3 main items here:

   1) a few FCC folk seem to be, uhh, out of touch
   2) data compression...I'm going to pass on that one
   3) AMTOR (my favorite mode these days)

In article <SRO.92Aug1213528@media-lab.media.mit.edu> sro@media.mit.edu
(Shawn O'Donnell) writes:

>A year or so ago I heard of some hams who heard from the FCC because
>they were sending ZIP-compressed files via packet. The FCC wanted to
>know what they were doing sending "encrypted data."

strange... the FCC folk who contacted them must have been severely out
of touch! it is not at all uncommon to transfer ZIP/ZOO/ARJ/whatever
compressed files via ftp (using the KA9Q software or some variant of
KA9Q's version). not to mention transferring the same type files to
plain AX.25 packet BBS systems.

btw, while I'm on that thought (and sorry for the deviation here) --- where would I get protocol specs for the file transfer protocols used to do binary file transfers with your normal, everyday, packet BBS?

>If, on the other hand, you design your own error-correction/
>compression algorithm, [....]
>In any case, do you know how few bytes per second you're likely to
>get? (Hint: you won't have to take off your shoes to count them.)

well, if you can average out to around 2:1 to 2.5:1 (that's based on modems that support V.42bis compression, and text data), that's about 2 to 2.5 times better than it was before. why complain? :-)

but, having found out that the net software already does this over AX.25 and/or TCP/IP over AX.25, why re-invent the wheel? I've been a bit out of touch with the net software, and wasn't aware that it was already using data compression.

>Do you know about AAMTOR? I've never used it, and I recognize people
>who do use it think it's a great improvement over its predecessors,
>but so far as I can tell, the protocol sends three bytes at a time.

I trust you ment AMTOR? or perhaps, AMTOR mode A? I'll assume this, but if there's a new mode of AMTOR around the corner, I'd love to hear about it!

anyways, yes, AMTOR is 3 characters at a time, and assuming a very clean connection (and a clear frequency), it falls way behind hf packet. but, when conditions are bad, AMTOR exceeds hf packet by a long shot. keep in mind, the larger the block size, the more you have to re-transmit every time there's an error....if you assume a very large number of errors, you want a very small block size. (ever notice, with modem transfers, how Zmodem reduces the block size as errors increase, and if the line clears up, gradually increases them again to maintain peak throughput?)

AMTOR is also much more persistant than packet.... after a set number of retries, packet gives up, period. AMTOR, on the other hand, will keep trying pretty much until you tell it to stop. NOTE: I have certainly seen cases where I saw a <LINK FAILED> message, but heard the other station (he was the Information Sending Station, as I recall) keep on trying until the link was re-established...it then picked up right where it left off before the link failed 5--10 minutes before.

and, of course, I can't type AMTOR without saying how much *FUN* AMTOR is, too.... great mode.

If it runs on a common machine, just send a few copies to the engineer
in charge of your district FCC office. Send a copy to the ARRL as well.

If you are keeping it propritary, maybe you should reconsider why you are
using on the ham bands.

>questions. If there is a FAQ that answers these questions, then just ignore
>this post and I'll get the FAQ when it comes along.

Don't know what a FAQ is. Could someone please tell me? I will however answer your questions as straight forward as I can.

>1 - How much does it cost to get a basic transciever that will connect to my
>   computer?

$40-$4000. I have seen good rigs for less and more so take your pick. YOu will probably have to spend about $100-$300 to get something you really want for VHF and it will probably be a 2m setup.

>2 - Can I get a tranceiver that will pretend that it's a telephone so that I
>   can use my current modem?

First of all, there is more to a packet setup than just the transciever. Actually, there is nothing special about a tranceiver to do packet unless you want to do it faster than 2400 baud. However, to do packet you need three things: A terminal type device, be that a PC or a real "terminal". A TNC (terminal node controller) which is actually a modem and networking device all in one. In some cases you can use simply a modem type device and put all the networking "smarts" in the software on the computer, ie; digicomm. Then comes the radio.

>3 - Once I have the equipment, how do I go about "getting connected?" Do I
>   have to register in my area or just go online? (Admittedly not very
>   likely.)

Just go online. You, of course, must have your Amateur Radio License. There is no registration required. You will probably have to monitor the channel (once you figure out what freq. that is) in your area to find stations/digipeaters/ BBSs that are around.

>4 - What types of communications protocols are used? What is KA9Q, and is
>   it THE protocol?

AX.25 mostly. TCP/IP sometimes and a few other experimental ones.

If it will run *any* type of terminal software that will talk to
a RS232C serial port, you can use it on packet.

Address your mail as follows:

        user%user-bbs%forwarding-bbs@your-system

        gm4xxx%gb7edn%bbs.gb7san@gm4yed.ampr.org

You have to add this to your DOMAIN.TXT :

        bbs.gb7san   IN   CNAME   gm4yed.ampr.org

Now your system will recognize bbs.gb7san and deliver it locally instead of
trying to send it smtp to some unknown host.

Next you need to build up \spool\rewrite file. A minimum entry would be:

        %%bbs.gb7san gb7san
        %@bbs.gb7san gb7san

This will intercept mail addressed as above, and send it locally into the
file \spool\mail\gb7san.txt

Now to do the forwarding file, \spool\forward.bbs:

        GB7SAN
        c ax0 gb7san
        gb7san

This is a bare minimum. The callsign at the top will be in the nos.log file as the ID of who the mail was sent to. The callsign at the bottom specifies that all smtp mail in \spool\mail\gn7san.txt be forwarded to the connected station. The "-----" line MUST be included. It indicates the end of the forwarding instructions. You can have several forwarding instructions in the file, and call out several file names to forward. Also, if a file called for forwarding is also listed in the \spool\areas file, it will be sent as a bulletin (SB) rather than private (SP). As a final note, for you to receive forwarded mail from your BBS, the To: callsign/name must be included in your DOMAIN.TXT. i.e. tcpip IN   CNAME   gm4yed.ampr.org. Then your system won't kick it back as bad, host unknown.

I had similar problems with BayCom 1.50a. The problem is in the scc.ini file supplied with the program. I used the scc.ini file from version 1.50 (it's in German) and it works fine. I had edited this text file several times, but could not find the problem. Retyping it should work, too, but I never got around to it.

>Above idea any good? Anyone ever done it?

I would think you'd get better results by having the repeater demodulate/
re-modulate the signal. For one thing, the repeater is hearing a cleaner
signal than the user station (each transmission unavoidably adds some
noise and distortion.) For another thing, you could equip the repeater
with a super-high-quality demodulator and modulator that would be too
expensive for a $69 TNC.

TTY repeaters have been doing real-time repeating for years, mostly
using the demod/re-mod technique.

I've tried my M100 with an MFJ-1274 and a Yaesu FT-727. After a minor mod
to the TNC (changing a resistor value I think) had no trouble keying the

radio. Unfortunately, so much RF interference came out of the TNC cables, that it made it virtually impossible to receive anything unless you were almost on top of the transmitting station. I verified this by removing all the cables from the TNC and sticking a battery pack inside. Just a couple of flat 4 AA cell holders from radio shack is all that's required. Of course since I was hunting for interference, and since the batteries weren't rechargable, I didn't connect the power cable. This eliminated the interference but obviously didn't make the TNC very usable. You still need an RS232. My solution was to get the antenna far enough away from the TNC so that the RF isn't a problem. It seems to work, but I don't use the M100 for this anymore. Looking at the 1274 unit and schematics, I can't figure out how the RF is getting out in the first place. There appear to be RF bypass caps on all lines going into and out of the unit. If anyone out there has found a better solution to this problem, I (and I'm sure others) would love to hear about it. It's a shame to homebound this quite portable packet station.

I've also written some software for the M100 to deal with the Computer Aided Tuning (CAT) system for the Yaesu. If there is some interest, perhaps I can post it/send it to an archive site/BBS.

Better Luck to you,
Donald K. George (KB6ZHN)

Hi Folks,

I am looking for a recent version of KA9Q for the ST. I found one for FTP on plains.nodak.edu, but it is dated somewhere in 1988.

I'm really looking for a NOS version rather than a NET version.

Any pointers gratefully received. Email preferred if possible.

Thanks in advance.

Tony.

I have received several replies (thank you all) the majority
of which said that the output op amp oscillating (at around
400KHz) was a known problem. The fix is supposedly to remove
C5. I can't verify this, since the guy whose modem I was
working on is out of town for a few days..

I now have a file containing several suggested fixes to
the tapr9600 modem (including this one), if anyone wants a
copy, drop me a line. I think it might already have made the
rounds over AX25 & UO-22...

Thanks,

No NOS, but there are versions of Phil's original NET software for Mac.
You can FTP the main version from ftp.apple.com (in the pub/ham-radio
directory). You'll also want to grab the mailing program (Bdale's Mailer).

Adam, PA2AGA, has expanded on the basic NET program, but I'm not
sure whether his software is FTP-able from anywhere (Dick??). And Ivo
Van Ursel, ON1XK, has an alternative mailer, but again, I'm not sure
where it's available from.

Patty

From: Patrick D. Smith
National Science Foundation
Division of Polar Programs

Subject: Call for Advice for AX.25 Packet Data Networks for HF and VHF Radio to Support Science Field Party Data/Text Communications in Antarctica for the United States Antarctic Program

Gentlemen:

I will make this brief so as not to clog the email with a long treatise, but here's the gist:

The National Science Foundation Division of Polar Programs is the executive manager of the US Antarctic Program. We run year round bases at McMurdo Station (77 51S, 166 40E), South Pole Station (90 00 S), and Palmer Station (64 46S, 64 03W) for scientific research. McMurdo Station supports a great deal of seasonal field work where small (3-4 person) to large (15-20) field camps deploy from 20 miles up to 1000 miles. If you should ever talk to any of our researchers, they would say that our communications support for the field researcher is lousy (for voice) and non-existant (for data, email). They are right, but I'm working on it. We are buying new synthesized tuned broadband HF radios that will be automatic link establishment capable, installing a remote HF receiver/antenna site for improved SNR, and developing VHF repeaters that can be used to cover some extremely mountanous terrain.

Concurrently with this, at McMurdo, we are installing C-Band commercial digial satellite service, and we expect to have a 128 kb/s direct Internet link. This will be interfaced to a base-wide Ethernet multi-protocol routing LAN, and we plan to implement full email service via the Internet with a MHS interface with the LAN DaVinci Mail system. We want to extend the SMTP email service out to the remote field user, plus attempt more advanced services such as FTP and Telnet. The end goal would be enabling the remote field researcher to interchange email and files with any Internet user.

The Antarctic Program does not have an unlimited budget, and the environmental and logistical issues dealing with doing anything in the Antarctic are significant (it's a big deal to have a 386 notebook computer operate successfully with a field party who is ski-dooing around the Antarctic, living in tents, and supported from a little 500 watt Honda gasoline generator, all at -20 deg C, for up to 1-2 months). Our concept is to try to keep things as simple as possible, and to leverage off as much developmental work

done by others as possible.

So, the intense activity of the amateur radio community, and as subsequently picked up by the commercial sector, has led me to post this notice asking for input from the community as to what techniques, packet hardware, packet software, protocols, network operating systems, etc, are currently available and at such a state of maturity that the US Antarctic Program could take these components and test bed a prototype field party data network.

I would appreciate any and all commentary or assistance that the community has to offer. Please send all replies directly to:

MFJ equipment I have used was not too well constructed, by the physical/mechanical assembly. The circuitry seemed ok.
The price is fair and other people I know have good things to say about MFJ products. Ken

I have a 1278, and I also like it. It could use a better CW algorithm, but who wants to do CW thru a modem, when they can do it by ear?

Anybody know where I can get a PD program for the 1278 that allows fax's etc to show on a PC?

A friend of mine is looking for the sources for Bdales Mailer for the Atari ST. I have looked all over ucsd for them, but all I could find were the IBM sources. If anybody could send them to me, or tell me where to find them, it would be most appreciated.

Thanks in advance

I am looking for anybody out there who is running MSYS 1.13 under WINDOWS 3.1
I have heard that the BBS software run's under other multi-tasking programs.
We are currently runing MSYS on a 8086 machine with 640K. We will be upgrading
our machine to a 386DX 33 MHz with 4MB of RAM.

Any sugestions or Comments are welcome.

Hi,

I have seen a few articles about the TAPR 9600 baud modem,
but I know very little about it. Are their any ftp sites
which carry any information, i.e. access to kits,
compatibilty with radios / G3RUH etc.

I would also like to hear from anyone who can give me any
info as to the cost and complexity.

Thanks in advance.

I also have one, difficult to find at a reasonable price in the UK
current dealers are after 279 pounds $530!!!! but luckily mail order exists
to the states.

I have had it for two years now and it works well. I could do with the new
firmware and bette rPC software (also not easily available here unless you
pay through the nose). Therefore I would be interested in PD software. I hear
MFJs offering does things to the hard disk, if this is so I would not touch
it.

CW is not good, but I have never come across any good CW modem.

I just uudecoded this and it appears to work well. I don't know if it
handles trutype yet but I look forward to the next version with the added
features.

It looks good on the screen too.

I had to reconfigure the ini file to take account of serial port 2
and at least the program told me what was wrong. Now I will try it on a slow
16MHz 286 to see if it can run in the background.

A good program.

We've done this with a 440 repeater in Pittsburgh and it works very
well. The terrain in this area makes the hidden-transmitter problem
quite severe and this repeater has eliminated that.

> Question is how to enforce packet use only, keeping
> old style voice users out.

Robert Smits, emd@ham.almanac.bc.ca replies:
> Actually, it's probably unnecessary. Voice users find listening to data
> so unbearable they usually go away very quickly.

This is exactly what we have found. We started out using a Bell 202T
compatible modem in the audio path between the receiver and the
transmitter. I found this to make debugging the repeater more difficult
because when a user was noisy into the machine, the result was perfectly
modulated but corrupted packets. We took the modem out and connected
it up as a normal voice repeater and we were then able to hear when
someone was noisy. We also took care to properly equalize the audio
passband because the transceiver used (an old GE Mastr-Pro base station)
tends to roll off the high frequencies.

From: hugh@ivy.unisys.com (KE3BI)
To: All TS-850S and KAM owners
Subject: Reducing Noise from KAM into TS-850S

I recently purchased a Kenwood TS-850S and really love the rig. I also use a Kantronics KAM TNC for all of the digital modes (HF and VHF) that I use. The following describes some of the problems and frustrations which I encountered while attempting to connect these two pieces of equipment together. I hope that some of my experiences explained below can save someone else the many headaches I have endured.

The TS-850S has an accessory plug ACC2 on the back panel (one of many) which has 13 pins. In the owner's manual these pins are described fairly well as to which pin is used for which function. Many of the control and output signals from the KAM can be brought into the TS-850S from this jack. This is a little less cluttered that using a modified 8-pin microphone jack and going in from the front panel.

Anyway, I used the interface cable supplied with the KAM from the HF output port (8-pin DIN) and wired the ACC2 plug supplied with the TS-850S as follows:

KAM PIN OUT	WIRE COLOR		TS-850S ACC2 PIN NUMBER	or TS-850S JACK
1	White	- AFSK OUT -----	11	-
2	Black/Shield	-----	4,8,12	CW/RTTY jack grounds
3	Brown	- PTT SWITCH -----	9	-
4	Orange	- CW KEY -----	-	CW KEY JACK (tip)
5	Red	- FSK OUT -----	-	RTTY-FSK JACK (tip)

All digital modes worked fine (AMTOR, RTTY, PACKET..etc) by using AFSK tones generated in the KAM, setting the TS-850S to LSB or USB, and modulating the RF signal with these tones.

The problem occured when I would use voice LSB or USB while the ACC2 plug was plugged into the the back of the TS-850S. Even though the KAM was in a receive mode only, and not keying the transmitter, I would get distortion on my voice signal. This distortion was heard over the air by others, and also could be heard using the monitor button on the front of the TS-850S while wearing headphones to listen to my own signal as I was transmitting. This distortion and noise was present when I was using

my vertical, dipole, and dummyload.

I thought this distortion/noise was maybe RF energy in the shack being rectified in the KAM and being sent back into the TS-850S through one of the lines on the ACC2 cable and plug. I called Kantronics to inform them of my findings and they said, "Oh, you must have a ground loop or something --- make sure all grounds are properly connected, especially since many Kenwood radios have a separate audio ground which is not at the same ground potential as the case or chassis ground." (loads of technical support, huh??!!)

So I went back and made sure all grounds from the KAM and Kenwood were secure, and that the shield on the cable between the KAM and the TS-850S was well connected to the ground for the TNC and the rig. The distortion was still there!!!

I also tried RF ferrite beads/cores on the outside of the cable with no difference in distortion or noise.

I found that the noise and distortion would go away completely by either unplugging the cable between the KAM and TS-850S, or by simply shutting off the KAM with the interface cable still connected to the ACC2 jack on back of the TS-850S.

THE PROBLEM is that there is noise (RF or microprocessor clock noise) coming from pin 1 of the KAM HF port (8-pin DIN plug) and traveling down the white audio lead of the interface cable and entering the rig through pin 11 of the ACC2 plug on the rear panel of the TS-850S.

I guess that Kenwood can`t shunt this line to ground during SSB, (or any voice mode for that matter), because AFSK uses this input to inject the audio signals from a TNC onto the output signal. But maybe Kantronics might be able to do more than just a blocking cap to ground to keep internal noise off of the audio lead coming out from the KAM.

MY SOLUTION was to install a small SPST switch in line with this white audio lead from the KAM to the TS-850S. I placed it very close to the ACC2 plug in back of the rig so as not to leave a large antenna for RF to enter the TS-850S when this audio lead switch is open.

I leave this switch open most of the time because usually I use the FSK mode on the TS-850S for most digital modes. In this mode, the mark and space tones are GENERATED in the TS-850S itself but SWITCHED by the FSK OUT line from the KAM (RED wire, pin 5) and into the TS-850S via the RTTY plug on back of the rig.

The standard shift out of the TS-850S is 170 HZ which is fine for RTTY and AMTOR, but for PACKET, the standard shift is 200 HZ. This shift can be changed in the TS-850S, however it has to be done from the power-up menu function and this is tedious and inconvenient with powering down and powering back up the rig to change this parameter.

So normally I use the FSK mode on the RIG and have the KAM send data

using the RTTY output (the switch installed on white audio lead is open), but if I want to use HF Packet (200 HZ shift instead of 170 HZ), I use LSB on the TS-850S (the switch installed on white audio lead from KAM is closed), and the tones are generated in the KAM (AFSK).

Note: the data from the KAM is sent out both ways all of the time. The AFSK audio goes to the TS-850S via the white wire from pin 1 on the KAM HF port to pin 11 of the ACC2 plug in the TS-850S, and RTTY (open/close) shift data goes to the TS-850S via the RED line from pin 5 on the KAM HF port to the RTTY/FSK jack on the back of the TS-850S.

I hope my ramblings above help some of you out there fighting similar problems. I am always looking for more info on the TS-850S, ie. undocumented features, mods, etc.

I have already done the MARS/CAP all band XMIT, and the Broadcast AM band attenuator defeat mods. Really love the rig ...
Any Questions or other Info always welcome.

I posted this once before, but I think inews "lost" the original,
my apologies if this appears twice.

I've heard rumours about a set of replacement roms for the GRAPES
56K modem, which allow it to use class C power amps, albeit at
the expense of bandwidth. Can anyone confirm or deny this ?
How much additional bandwidth does it take ? What practical
effect does this have on performance ?

While I'm waiting for my information pack to arrive from GRAPES,
can anyone tell me if the modems come shipped with crystal(s) ?
If so what is the standard IF freq ?

Thanks,
--

Two comments on the pktwin04.zip posting:

1. I decoded this four part package, and the zip file was corrupted.
    PKZIPFIX allowed me to extract things, but then the exe file failed
    the CRC.

2. Why was approximately 250K of uuencoded file posted to the entire
    network? Especially in light of the errors I received decoding it.
    What ever happened to posting a short brief of the programs abilities
    and availability via fpt, email or diskette mail.

Hello!
This is regarding the Wavelan Communications Adapter (#3299-k970-v004)

     I have been attempting to use the NCR WaveLAN wireless network
card with the KA9Q NOS to bridge my wireless network to a standard
wired ethernet LAN. The wavelan manual mentions compatibilty of the
card with TCP/IP systems, and specifies the drivers needed to use
with FTP's PCTCP package using which I am able to ftp between two
PC ATs with the NCR cards. The NDIS driver provided by NCR is named
dncrwl02.dos and is included in the config.sys file along with the
netbind related files as required. The protocol.ini file has the
following form:

[WAVELAN]
     drivername=ncrwve$

```
     IOBase=03E0
     ACR = 6

[PKTDRV]
     drivername= PKTDRV
     bindings=WAVELAN
     intvec=0x65

------------------------------

     I tried using : attach packet 0x65 ncrwve$ 5 1500
in the autoexec.net file which yields:
No packet driver loaded at 0x65
Could not attach packet driver

     trying the same after using "netbind" yields:
Packet driver has unsupported class 9
Could not attach packet driver.

     I would appreciate any suggestions or ideas. thanks

I have a couple of probably pretty easy TCP/IP questions for the net.
I deal with TCP/IP on a mainframe VAX daily so I do know what it is,
how it works, which file do what, etc. Amateur Packet TCP/IP is
non-existent in this area so there's no one to ask about software, etc.
SO, on to the questions:

I know there are several versions of NOS available.   I've looked through
several at UCSD.EDU. Can someone give me a run down on differences and
preferences?

Can someone tell me who to request an IP address from in my area.
I'm located in Central Louisiana.

Tnx for any help

I've got an MFJ-1270b, and I'm having a similar problem, though I'm trying to hook up to a Yaesu 411e HT and a Mac (haven't gone for the M100 yet). First time through, I managed to get receive from my HT to the TNC fine, but PTT didn't work. I was told by MFJ to add a resistor/capacitor combo to the cable, which activated PTT fine, but brought a noise level of about S7 to the HT receive, drowning out all incoming stations. Now I've gotten advice to 1) move the antenna as far away as possible (though the interference seems to be coming through the cable rather than through the air to the HT); 2) put the resistor inside in place of R107 (I think) and remove the capacitor; and 3) (this came from MFJ support, gang) to shave off the paint between the top and bottom covers and run a ground to the computer. No offense, MFJ, but this seems like a lot of extra work for something that's supposed to work off the shelf.
Donald, I'd like to hear in e-mail you hooked up to the 727, which is probably similar to the 411, other than yours is a dual-bander while mine is only 2m. I also would like to hear the resistor you used and where you put it. MFJ has given me a lot of information at different times, lots of it contradictory to the info received in the previous phone call. If you are nearby, in Southern California (as your call might indicate), I'd like to see your set up. I think it would help me (finally) get my system on the air. Once I get the 411 and TNC hooked together, I'm going to get the M100

going too. Thanks...

"Cooling" Mod for the PK232 MBX

by Tom, AB5FH
AB5FH @ N5LJF.#AUS.TX.USA.NA

23 July 1992 (REVISED)

For all PK232 MBX owners, place your hand on the top, middle, right side of the PK232 case. If it appears warm-to-hot after one hour of operation, read on. The power voltage regulator/heatsink is mounted to the circuit board below this point. This regulator is an LM317T voltage regulator capable of dissipating approximately 15 watts. In normal packet mode, this regulator sources approximately 700 milliamps with a voltage drop (across the LM317T) of approximately 6.7 volts. This results in a power dissipation for the LM317T of approximately 4.7 watts. While this is 1/3 of the capability of the LM317T, this heat is driven into the circuit board. While replacing a defective radio selector switch, I noticed that the circuit board under the heat sink was charred. This particular PK 232 MBX has been in operation approximately 3 years. A review of the schematic revealed that there was no series dropping resistor in series with the LM317T input. This resistor is used to reduce the input voltage to the LM317T which in turn reduces the voltage drop across regulator. With this voltage reduction, the power dissipation of the device is reduced. I paralleled two 10 ohm, 2 watt resistors and placed them in series with the cathode of D11. This reduced the dissipation power of the LM317T by approximately 30%. Consequenty, the entire unit runs exceptionally cooler with no degradation in performance. The heat will be dissipated by the resistors (instead of the LM317T) and then be

conducted into the case. The two paralleled resistors were placed adjacent to the heat sink, and along the edge of the circuit board. These resistor should be installed so that they are at least 1/4" above the circuit board. You can make this mod from the top of the board since the circuit board trace to this resistor is on the top side and the hole feedthru is plated thru the board. Locate and lift up diode D11(large bodied diode closest to the side edge of the board near the LM317T regulator.) from the cathode side (banded end). Use a low wattage iron and wick soldlead. The resistor lead that is to be placed in that hole must be trimmed so
that no more than 1/16" of lead extends from the underside of the board. If you are uncomfortable with this step, you may remove the circuit board to expose the underside of the board. Place one lead of the paralleled resistor assembly in that hole and solder in place. Be sure that the resistor pair sits above the circuit board. It helps to let the resistors lay over on their while they are soldered in place. This will force the pair to be sit
above the board. Position the other lead end of the resistor pair such that it connects to the cathode (band end) of diode D11. Solder the resistor lead to the DII diode lead. Position the resistor pair so that their leads are not in contact with the LM317T heatsink or the 1000 ufd filter capacitor (C26). The resistor pair was obtained from Radio Shack (part no. 271-080 - $.99) and that was done to my PK232 MBX is optional due to its aesthetic result. A pattern of 8 holes (0.1" in dia) were drilled in the cover above the heat sink and resistor pair. With the holes drilled in the case top, there is no noticeable heat rise detected on the cover and no degradation in performance in all modes. I have operated the modified unit for over 2 weeks since the modification without disconnecting power with no degradation in performance
It is also important to note that the AEA transformer supplied to power the PK 232 outputs DC voltage in excess of 17 volts unloaded. This can be checked by placing a meter on the connector end of the transformer unit while it is plugged in. When connected to the PK232, the load of the PK232 MBX drops this voltage to approximately 13 volts (nominal). If you have a newer PK232MBX (> s/n 50000 and with multicolored LED's), you will have a 7805 regulator in place of the LM317T. This fix still applies to the 7805 regulator circuit.

A friend of mine tried to use a model 100 or 102 (not sure which) with a Kam for amtor.
The results weren't pretty. The tandy made so much noise that we couldn't keep the
Kenwood 440 from breaking squelch, and whenever the radio was keyed up, the tandy re-
booted. We were operating outdoors with a 40m dipole about 15 feet up, 20 feet away.

Or, it could have been zipped with the v1.9[51]/"2.01" zipper that's
floating around. Guess that they didn't have a zipfile version
number buried in at the beginning.

Albert Einstein, when asked to describe radio, replied: "You see, wire telegraph is a kind of a very, very long cat. You pull his tail in New York and his head is meowing in Los Angeles. Do you understand this? And radio operates exactly the same way: you send signals here, they receive them there. The only difference is that there is no cat."

The LM317T needs no series input resistor in this application. What it does probably need is a better heatsink. Adding a series resistor makes the unit suseptible to erratic operation during brownout conditions.

>dissipation power of the LM317T by approximately 30%. Consequenty, the entire
>unit runs exceptionally cooler with no degradation in performance.

This is an illusion. The power that was being dissipated in the LM317T's heat-sink in now being dissipated in the resistors and the LM317T's heatsink. The key point here is that the power dissipation is EXACTLY THE SAME as it was before you made your modification. It is now just spread out a bit.

Don't do this modification. It serves no real purpose. The LM317T was never in any peril. This chip contains circuitry that will shut it down if it is overheated. It can run in this shutdown condition indefinitely without damage. All the above modification will succeed in doing is decrease the input voltage range over which the TNC can reliably operate. If you really want to improve the lifetime of the regulator, work out a way to mount it to the chassis, or give it a better heatsink.

Mike Willis decoded it also without problems as I see in another followup
posting to the original 4 parts. I also didn't encounter any problems.
I used ZIP on a NeXT to check it out, and it PKUNZIP'ed (v1.01) on my
DOS box without problems.

>2. Why was approximately 250K of uuencoded file posted to the entire
> network? Especially in light of the errors I received decoding it.
> What ever happened to posting a short brief of the programs abilities
> and availability via fpt, email or diskette mail.

Is this that bad? Do we need a rec.radio.amateur.packet.binaries now?
(And if the resultant zip file hadn't been "corrupted", would the comment
have still been made? I generally retry the decoding from the original
article(s) before giving up on it being a "bad" posting... There certainly
are much larger, more humungous postings in some other newsgroups...)

Just another note on the duplex packet repeater operations. I was in
Calgary a few months back (just moved to Winnipeg) and there was an
awful time trying to do something with the "backbone" on 145.01, so
a local ham put up a duplex bit-regenerative packet repeater on one
of the tall downtown bulidings and when people moved over, you could
actually get some data moved around. It was phenomenol ... the data
throuput must have at least quadrupled ... lots of low power stations
being clobbered by higher powered stations ... lots of hidden nodes
... now that ve6pax is up, no problem.
just my 2 bits.
Dan

 Sb: 110, 112, 1200 MODS SAME!

Hello FELLOW Packeteers! I just got off the phone with Matt from Alinco!
I have been asked if the 9600 baud Mod that I posted would also work for the
110. YES IT WILL! The 110, 112 and 1200 radios are identical except for
the power output of the 1200 (25-watts high power compared to the 45-watts of
the 110 and 112!) and the 112 has a LCD display to replace the piece of junk
one on the 110! Also, if you want to have more power in the 1200, you can buy
the 100/112 PA Board (45-watts) for $65.00 from Alinco. It also requires
buying 4 high power switching diodes for $20.00 from Alinco. $85.00 for
20-watts?...Doesn't sound like a good investment to me. Don't forget the time
involved with doing this mod. I discourage the use of HIGH POWER and have
posted bulletins on this subject! Never the less, I feel obligated to pass
this info on to you, I am not the U.S. Government, I will NOT keep things
from you! To follow is the 9600 baud Mod I received from Alinco. Alinco
warns that the Warranty is void if this Mod is performed! KA1BOY has been
great enough to try this Mod and says it works great for 1200 baud as well
as 9600 baud! From all of us to you, THANK YOU BARRY! One point to remember,
you will not be able to use the radio for voice. This mod uses the Mic
Connector...

TRANSMITTER

1. Remove R-31
2. Remove C-40 (save this part, it is to be reused!)
3. Connect one leg of C-40 to PIN 7 of the VCO Board
4. Connect a jumper from the free leg of C-40 to the HOT end of C-35
   The MIC input is now connected DIRECTLY to the VCO!

RECEIVER

1. Disconnect the PINK wire connected to the MIC connector and the PC Board
   from the PC Board
2. Reconnect the PINK wire to PIN 2 on the IF Board connector
   This eliminates the low pass filtering on the discriminator!

That is it to the MOD for the 110, 112, and the 1200! Remember, you now use
the MIC Connector For inputting 9600 baud and it WILL work for 1200 baud!
A special note to all SYSOPS out there...Buy this radio and do this MOD! It
will allow users to set their TXDelay down to a lower setting giving the
channel MORE throughput! USERS, make a DONATION to your SYSOPS so they can
help make the system YOU are using, BETTER! We must all do our part to help!
I would like to hear from all of you that tries this MOD!

I GIVE PARTIAL CREDIT TO BARRY, KA1BOY, FOR HIS INPUT ON THIS MODIFICATION!!!
73 FELLOW PACKETEERS!!! DINO...KC6RIX @ WF6O.#SOCA.CA.USA.NA

In-Reply-To: wa2ise@cbnewsb.cb.att.com's message of Sun, 26 Jul 1992 04: 35:34 GMT

I have made this mod, and I have the following suggestions:
(a) you can get a "map" of the board via FAX or snail mail from Alinco
    -- this helps a LOT (it's impossible to read component labels) --
    Alinco is in Torrance Calif, in the phone directory.
(b) Throw away C40, it is impossible for a mere mortal to do what they
    are suggesting. Replace that SMT C40 with an axial .01uf cap
    (non-polarized, anything kind you want, I used a tant.) and some
    insulation tubing over the leads (it needs to stretch 2 inches
    across the bottom of the pcb.

Alinco claims this mod makes 1200bps unusable, untrue, I use my modded
1200 on both 1200 and 9600 bps without noticable degredation of
performance.

Regards,
Paul

I have in front of me, a ZyXEL U-1496S modem.   This is the sort of
state-of-the-art-modem I would have had my group design were I still
working in modem research at Gandalf Data.

It has a 2 line by 20 character LCD display, menu-tree programming from

the screen via 4 pushbuttons, and implements a whole bunch of CCITT protocols up to 14,400 v.32bis/v.42.bis, and v.17 FAX. Needless to say, it does both sync and async, and even has modes for use with cellular and satellite.

(Presently, the operation modes are: v.33; v.32bis; v.32; v.29; v.27ter; v.22bis; v.22; BELL 212A; G3 FAX according to T30, v.17, v.29 and v.27ter; and most variants.)

What does the display do besides allow you to program all the registers? Well, you can not only see the incoming connect speed, but also things like:

- Signal-to-noise ratio
- Received Carrier Power Level
- Phase Jitter (p-p degrees with .1 deg resolution)
- Frequency offset between TX and RX freqs (in .1 Hz res)
- Round-trip echo delay in (1/2400 sec)

...and a whole lot more.

After your communication session has finished, you can even call up (by an AT-command) a "Link Status Report" which will give you:

- Chars sent; Chars rcvd; Octets sent; Octets Rcvd
- Blocks sent; Blocks rcvd; Blocks re-sent;
- Max Outstanding; Max Block Size;
- Retrain requests; Retrains granted; Link duration;
- T401 timeouts; T402 Timeouts; FCS Errors;
- Round-trip delay; Xmtr under-run; Rcvr Over-run
- Reason for disconnect.

With the latest ROM revisions, it handles Caller ID, 4 different ringing codes, and the maximum speed is 16,800 baud. (They are working, I believe on 19,200 baud.)

Finally, for the technically minded, it can even be supplied with X- and Y-axis outputs for a scope, so that you can see "eye" or "constellation" diagrams.

There are three telephone receptacles for telco line connexions: One for a local phone; one for 2/4-wire leased-line, and one for 2-wire dial-up line. (The dial-up line even supports telco 1A-key system A-leads for lamp status control.)

Lots of features have been left out of this little blurb to try to keep it as short as I can.

Upgrades? Well, they are via a couple of 27C010-15 (1Mb) ROMs, and the binaries are usually posted on their BBS, or available via FTP or mail-server from various sources (including here). So, if you have access to a ROM-burner, you can do the upgrades yourself.

Just had to let you know about this great little modem, in case you

hadn't already heard.

Anyhow, having said all of that, you can get most info (including TIFF-image files at 300dpi) from my mail-server. To save space, the files have been compressed with ZOO, which is available for most O/S from DOS to UNIX. (ZOO version 2.10 for DOS and for UNIX is available via mail-server request from this site.)

To get started with the mail-server, send e-mail to:

mail-server@questor.wimsey.bc.ca

and in the body of the text, enter the following at the left margin, with nothing else in the body:

HELP
INFO
INFO INDEX
INFO FILINDX

Warm regards to all.

Well if you are *REALLY* that worried about bandwidth, why post this, why not EMail it :-)

Sorry if I offended *YOU* by positing somthing to this group, somthing I thought might be usefull. Well to me anyway *IF* I get any feedback. However, this is a low volume group, and larger things are regularly posted onto other groups that are far busier. Maybe this is why :-)

Thanks to the others who also posted replies to this message in my support. Although I don't consider myself a newbie (just don't post enough ;-), naive, OK I'll admit to that.

Paul

I just uploaded to ucsd.edu version 2.3.0 of NET/Mac by PA2AGA. The
following files are in the ~ftp/hamradio/packet/tcpip/incoming directory:

netmac230.sit.hqx   - archive containing PA2AGA NET/Mac version 2.3.0
                        executable. This version has lots of bug fixes
                        and enhancements not in earlier versions.

netmac.env.sit.hqx   - archive with some "environment" files, like
                        autoexec.net, ftpusers, spool directories, etc...,
                        plus the latest version of IM/Mac mailer by
                        ON1XK.

Please contact Adam, PA2AGA (adam@IGG.TNO.NL) for support questions, you
can contact me (jmr@ruth.ece.psu.edu) if you have trouble uncompressing

the distribution files.

Brian -- Maybe you could move these to a directory like
~ftp/hamradio/packet/tcpip/mac or ~ftp/hamradio/packet/tcpip/pa2aga ???

I disagree. It was aimed at a particular target audience, and it was
aimed to get the widest distribution. The majority of the news reading
public do not have direct access to FTP. Albeit they have it thru the
remote mail servers, but mail costs excessive amounts of money in this
country, so I for one, am jolly glad that he posted it to the newsgroup
or I would never have seen it.

IMHO of course.

And Noah Spake unto his children: "Scattered showers my arse!"

Brown) writes:
>[these comments apply to AmigaNOS 2.9b (I think that's the most recent
>version)]

I did the original port of AmigaNOS, which has since been picked up
by someone else. That's real good, since I no longer own an Amiga.

>Second -- Why is the serial port being opened with SERF_RAD_BOOGIE?
>This is only necessary if you're doing MIDI (or, I suppose, 56K
>packet). The code includes a /* ? */ comment when it sets the flag,

>done either. The SERF_RAD_BOOGIE flag disables some internal checking --
>I removed the flag, and it seems to work fine (but then, I only used
>it at 9600 baud -- hardly MIDI speed).

The intent was to make the serial device driver work as fast and
efficiently as possible. I didn't see any point in it doing anything
clever at all, like checking parity or stuff.

>Third: I had no end of problems getting AmigaNOS to work, until I noticed
>that I only seemed to have problems when I used a port on my A2232
>7 serial port board. When I used the built-in serial port, everything

>send anything to the program until some buffer overflowed. Anybody
>else have experience with this?

AmigaNOS sets the termination character array to the SLIP framing character
0xC0, and puts up an I/O request for the maximum sized frame. That way,
the number of context switches is significantly reduced and the the user's
process is only woken up when I has to do something, rather than look at
every characters. The problem seems to be that (I've heard) the device
dricer for the A2232 many not support that function (the termination
character array).

>Fourth: It would be nice if instead of opening windows on the workbench,
>it would open them on the default public screen. This is an easy fix
>as well -- set the PUBLIC_SCREEN bit in the NewWindow structure. (well,
>that may not be EXACTLY it, but it is simple. This is another fix I've
>done privately)

Gee, last time I had an amiga with version 1.2, didn't have anything like
that!

>Fifth: (This is merely a peeve) It would be nice if AmigaNOS used the Amiga's
>inherently multitasking OS instead of the internal task switching hack
>(not an insult) carried over from the PC. Looking over the code, this
>looks like a major task for anyone without intimate familiarity with
>the NOS code (which I, regretably, don't have), but I believe it would
>clean things up immensly.

This most certaily will NOT work. The tasking package used in NOS
assumes that the processes run to completion or until they volunarily
give up control. This assumption is implicit in the way the the
various processes in NOS access shared data structures. Since the
amiga OS's processes time slice, you'd have to find *all* the places
that shared data exists and add locking primitives around them. This would
then make your version of NOS completely unique and non-portable.

>Sixth: (this is pure blue sky) Re-writing the various pieces of AmigaNOS
>as a full-blown AmigaOS device would be very cool -- Any extensions
>can then be distributed as stand-alone executables, without the hassle
>of recompiling the entire NOS executable just to add a little bit of
>functionality. I think this has been brought up before.

I starting thinking about this real, real hard and came to the conclusion that what I really wanted was a real UNIX box. So now I have a NeXTstation and not an Amiga. I never got very far.

>Anyway, AmigaNOS is, in general, a very fine program. Hopefully some
>of my suggestions can be incorporated into the next version.

One of my prime goals when I was hacking early AmigaNET and AmigaNOS was to maintain compatibility with the base source code as much as possible to allow easy upgrades to new versions and to be able to feedback the changes that I make to Phil for inclusion in subsequent versions. I'm not at all familiar with what happend to AmigaNOS after I stopped working on it, and if that's the case any longer or not.

>(Of course, this is meant for g1yyh (I think that's it) in specific,
>and the net in general. I would have sent it directly to g1yyh, but
>all I have is a packet address)

Yeah, and just one more thing. Before anyone asks, I *don't* have *any* bits of my versions of AmigaNOS left. I don't have an Amiga or any way to make disks. I still get random requests for the code due to some old QST article, but they've tapered off... G1YYH is, I belive, the definitive source for later AmigaNOS versions.

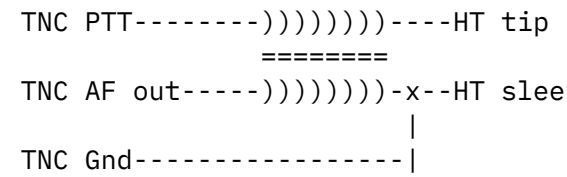
Hi,

I`m running NOS 2.0f (PA0GRI) and having some problems with SMTP.
When my SMTP system tries to forward a msg to another local amateur it tries

to solicit connection using LZW compression. This causes my friends system to crash out or hang, is there any way of explicitly turning off LZW compression on SMTP transfers !!!.

Incidently my friend is running AMIGANOS 2.8s (I think but not too sure on the version).



Thanks in anticipation.

Robin Alexander.

One of the best ways to interface one of these "leaky" ground PTT HTs to
a TNC is via a transformer. This works for Yaesu, Icom, and RS units.

Any 1:1 AF transformer will work. Radio Shack has several tiny ones in
a grab bag that do fine. Your TNC should have an audio output adjustment.
For TAPR style TNCs, you can get lots of drive. With Kantronics TNCs, you
may need to change a jumper on the TNC to get enough drive. Consult the
manual.

I'd appreciate it if someone would send me the commands necessary to
put a PK-232MBX in KISS mode. The tutorial to NOS I have includes
both the commands:
KISS ON
HOST ON

However, doing either one makes the TNC stop accepting commands. I'd just
like to know from someone who actually does it what it takes and if these
commands can be put in autoexec.nos.

Oh, how do I get it out of KISS mode? Doing a long power cycle does it

now, but I think my battery inside is dead. What's the better way?

Thanks for the info and 73
Jeff

Is anybody running 9600 or faster?
Can anyone tell me about TCP/IP in the NYC area?

I would like to get some IP numbers, because several members of the Columbia
University Amateur Radio Club want to experiment with it. I would like to
get suggestions on the cheapest/most effective/most compatible/best setups
for starting out from scratch. Does anyone have recommendations on a modem
standard? How easy is it to mosify a stock HT?

All information is much appreciated.

Thank you very much.

> 1) Is there really any significant differnces in the commands used

Not really. Packet is Packet and a MAJORITY of the commands are the same.

> 2) I was thinking of skipping the multimode data controllers...

Gasp! You mean you're not going to run out and buy the PK-232 just to test?
Actually a VERY wise choice for beginning packet (ie not multi-mode)

> 3) I was thinking of the MFJ-1270B or the MFJ-1274.

No, they are identical except that the 12764 has a tuning indicator.
This REALLY helps with HF packet. They both do HF packet.

> 4) I am seriously considering a 2400 baud modem for it,

Don't bother. THere's not enough 2400 users out there. Run with 1200
and get a feel for Packet, then make the jump to 9600 (cheap to do)

> 5) what do you guys suggest for good programs to run the TNC with?

Just about ANY terminal program. Procomm, etc. works FINE for packet. The
TNC's are designed to be interfaced with a dumb terminal. If you're going
to run TCP/IP, I suggest running one of the PA0GRI or PE1CHL variants.

Personal suggestions for equipment: Buy a PacComm Tiny-2. The manual is WELL
written. The Tiny-2 is a TNC-2 clone and the aftermarket EPROM firmware will
work in it. WA8DED's host and net/rom firmware, and TAPR KISS EPROMS drop
right into it. Second bet would be the MFJ-1270b for the same reasons. If you
want to run HF packet, get the 1274 since it has the tuning indicator! Also,
all of the above are SIMPLE to upgrade to 9600 baud.

For further questions/answers/opinions see the sig text.

>different TNCs by Kantronics, MFJ, and AEA? or do most programs work with any

>of them? Is there enough differnce to justify the cost difference? Be
>specific please.

The basic firmware command sets divide into Kantronics vs everyone else.
In addition, the multimode controllers have their own unique commands.
If you are satisfied to interact with the firmware command set, then
any terminal program will work. Some TNCs, AEA PK-232 for example, have
a special "host" mode that is designed to be software friendly. Thus there
are specialized programs that talk to specific TNCs in this host mode.
AEA's PC Packratt program is an example. IMHO the firmware differences
are *not* worth extra cost.

>2) I was thinking of skipping the multimode data controllers... Is this wise?
>Is there that much use of AMTOR and everything else to justify the $100? If so,
>what do they offer that packet does not?

On *HF*, AMTOR is superior to packet for thruput. It's in wide use
worldwide. RTTY is still in common use as well, though it doesn't
offer any error detection. On VHF and above, packet dominates.

>3) I was thinking of the MFJ-1270B or the MFJ-1274. Am I correct that they are
>basically the same but the 1270B is missing the HF modem?

The only difference between these two TNCs is the tuning indicator. Both
will work at HF.

>4) I am seriously considering a 2400 baud modem for it, I would assume that
>most out there now use 2400 baud? (1200 is to darn slow in my opinion.) Anyone
>have a percentage approximation? For now, I'll hold off with the 9600 baud
>modem.

2400 baud offers little thruput advantage due to the protocol and
turnaround overhead. Typical thruput improvement for 2400 baud over 1200
baud is less than 25%. Aside from use on the DX spotting Packetcluster,
2400 baud TNCs are uncommon. The majority of VHF use remains at 1200 baud
with the next worthwhile speed stepup at 9600 baud. Thruput increases of
two to three times are typical with 9600 baud. Packet is an ARQ protocol
with fixed header overhead and *half duplex* channel turnaround overhead.
With normal single line per packet transmissions, the delays are longer
than the data. Channel sharing further reduces the thruput. Going to maximum
length frames can improve thruput fairly dramatically on a nonshared channel.
On a busy shared channel, effective thruput can drop below 50 baud. There
is no correspondence with full duplex telephone modem performance.

>5) what do you guys suggest for good programs to run the TNC with? I'm
>interested in general chat, mailing, but also running TCP/IP over it.

For a standard TNC with standard firmware, any telcom program is fine.
ProComm is popular. There are programs written especially for packet
use, but they offer little real advantage. For TCP/IP use, you need
KISS firmware in the TNC and KA9Q NOS as the operating software. Most
of the new TNCs offer a KISS mode in their firmware, but I prefer to
replace the firmware ROM with an optimized KISS only ROM. That way

there is no danger that the TNC can unexpectedly drop out of KISS
mode during a session. All TAPR clones will accept the KISS firmware
ROM. Non-standard TNCs like Kantronics and the multimodes have to
depend on built in KISS modes. Note that there are problems with
some of these KISS implementations. There is no NOS for Apple IIe
systems.

Check out SS. 97.307(f) "Emission Standards"

Frequency	Max Data Speed	
1.80 - 24.93 MHz	300 baud	= Below 10m
28.0 - 28.3 MHz	1200 baud	= 10m
50.1 - 148 MHz	19.6k baud	= 6m & 2m
222 - 450 MHz	56k baud	= 1.25 & 70cm
902 and above MHz	unlimited	= Above 70cm

Hello !

Where can I find the article about the G3RUH modem ? Information
about other 9600 bps designs are welcome too.

Thanks

I was talking with a few Hams in Texas and they mentioned a Mod or a fix
for
the flicking of the DCD light on the MFJ-1270B with the G3ruh Modems.

Any help will be appreciated!!!

Thanks

>902 and above MHz unlimited = Above 70cm

Putting a limit on the maximum data speed seems akin to putting a limit on
maximum fuel efficiency of automobiles. I just don't see any reason for
it. I can understand a limitation on *bandwidth*, but as long as you can
squeeze more throughput out of that bandwidth, more power to you!

Anyway, expressing the limitation in "baud" seems to leave the door open
for higher bit-per-second rates while staying within the letter of the
law. The notion of "baud" isn't even clearly defined. Many people argue
that Telebit's PEP protocol for land-line modems gets on the order of 15K
bps with only 7 "baud."

Nevertheless, I would hope that a proposal for a rule change in this area is
in the works. If there was ever such a thing as a "victimless crime,"
this has got to be it :-)

I've been trying to get my PK232MBX to work with G3RUH 9600 baud modem. I
know that TAPR sells a disconnect kit for PK232 and did consider buying it

first but the banks here in Finland rip you off when you buy foreign currency in small amounts ;(I've got it working, well sort of, the only problem is that it drops received characters now and then (about 5% of total input). Does anyone have good ideas on how to cure this? I suspect that the PK232MBX just isn't able to swallow all the data from the G3RUH modem fast enough. My eprom is dated 1990, July I think.

So if you have any ideas how to help me on this I'd appreciate to hear from you.

Yes, it should stop accepting commands right after the KISS ON command.
The PK-232 goes immideatly into KISS mode and you can start working with
NOS. You can put the KISS ON command in autoexec.nos but I have not done
that so I can't help you there. (I usually have my PK232 in KISS mode all
the time).

> Oh, how do I get it out of KISS mode? Doing a long power cycle does it

Type CTRL-C 3 times and wait 1-2 seconds, you should get the cmd: prompt
then. I think that a long break should do it also? Not sure though about
that.

First I would like to indicate that I resolved my earlier problem in getting my PK232MBX to talk to Lan-Link. I had been using the Fast Iniitialization mode with PakRatt II and as a result the host mode was on when I disconnected. Changing this and putting autobaud to "on" solved this and all is working now.

I have a question re using Lan-link to use the features of HOST mode in the 232. I would llike to use the signal command to recognize signal parameters, and use the OK command to switch automatically to the mode, rate etc I would like to change to. I was thinking of using the L-L.00X files to send commands to the PK232 in such a way that re-initialization etc is not necessay via the Lan-Link menus. Has anyone tried optimizing Lan-Link in this way to use the Host mode in the 232MBX? I do have the tech. ref. manual on order - so I suspect that there will be ideas there - but any suggestions from those who may be doing this would be appreciated.

Comments and suggestions would be appreciated. Please E-Mail me at SEELER@UPEI.CA. I will summarize responses if it is possible.

Here's a beginners question(s)...I've recently purchased a used MFJ-1270, and am wondering if I am missing any features by not having a current ROM. I didn't write down the version # but I think the date is around 1988? I know that it has the ax25l2v2 command if that counts for anything. I would like to run tcp/ip and am not sure if this guy will do it. Also, any good books that anyone can recommend (other than the beginners arrl publication) would be appreciated.

It's the BayComm modem in a shell, and I believe it is available from PacComm
and Tiger Tronics along with the Software. It is a MODEM only and the packet
ax.25 bit-bashing is done with the software inside the computer.

I have been trying to get slfp.c to work properly on a Toshiba 386
running DOS 5 and the latest copy of Borland's Turbo C. However,
the vector setting method, using "hookptr" to slide in the
"PKT DRV" signature is giving me some fits. Also, if I get by this
problem through some assembly hacking, I still run into problems with
the Data Segment being different than the Stack Segment.

I assume this has something to do with the compilation switches,
although I am using the makefile supplied in the KA9Q distribution
and still run into problems. Any Hints ??

Some time ago, there was a discussion on using a two frequency repeater
to service a local area and avoid "hidden" stations. Repeater would
retransmit without time delay the packets it hears on the input freq
on the output freq. Question is how to enforce packet use only, keeping
old style voice users out. One way would be to demod and remodulate the
packet tones. How about this: Pass the recieved audio directly to the
transmitter, but have a circuit listen and detect the continuous presense
of packet tones, and shut off the transmitter if the tones are not
continuous (evidence of a voice user). Thus, a voice user only triggers
the repeater for something like a second before being dumped out.
But a packet user gets permitted to use the machine beyond that time.
You get nearly non-delayed packet retransmission, thus reducing
collisions. And you avoid possible innacurate demod and remodulation
of the packets being done in real time.
Above idea any good?   Anyone ever done it?

It should work. Experiment with the TXD until it is a short as possible but doesn't "clip" the first part of the transmission.

Put the Regency on a dummy load, listen with another radio, set TXD to 900mS, and transmit a digital message. Keep shortening the TXD until you hear a very short pause (dead air) space at the beginning of each transmission.

The Regency has a horrible receiver. Ultra-wide, but if your signals are fairly good, it should do well. Regency had a "narrow-band" modification kit for the 2A; if that's what you have, I could send you a copy of the docs. You may be able to find parts to affect the mod, if you like.

See you on packet!

I don't think that work/NOT work enters into it. When I first thought
of doing the conversion, I took all of the problems you mentioned
into consideration. I was also not really that worried about maintaining
source code compatibilty -- my aim in adapting the code is different
than your original intent. Not better, just different. I like portable
code as much as the next guy, but nothing beats a program that has been
designed for a specific system.

On the other hand, it was exactly those problems that you mentioned that
made me decide that I really didn't have the time to dig into the
code.

>>Sixth: (this is pure blue sky) Re-writing the various pieces of AmigaNOS

>
>I starting thinking about this real, real hard and came to the
>conclusion that what I really wanted was a real UNIX box. So now I
>have a NeXTstation and not an Amiga. I never got very far.

I'm not quite sure I follow that particular bit of reasoning...

As long as NOS, in its various incarnations, remains a monolithic program,

changes and additions will be painful. If a group of people could get
together and provide device interfaces for the various platforms (a
device on the amiga, a device driver for MSDOS/Windows/OS/2, and
whatever the equivalent bit of software for a Mac is), we could keep
most of the machine peculiarities in the drivers and have a large
common application code base to work with.

To try to clarify the previous paragraph, a quick glance through the
NOS source code shows that a socket interface is used internally.
Unfortunately, the socket interface is only INTERNAL to NOS. You can't
just take one of the many socket-based apps and link it with NOS's sockets --
you have to actually incorporate the app's code into the monolithic
structure, with the corresponding increase in memory footprint and
load time. If we made the packet TCP/IP software interface public, it would
be simple to just use the features you want, without wasting memory with
features that aren't used.

I have the same question regarding an old Tempo S1 HT (made by Henry
Radio). Is it suitable for packet?

Boy, I hope that's not true. I doubt that the PK-232 is inteligent enough to know the difference between a user trying to get out of KISS mode and a data stream that just happens to contain 3 ^C's in a row.

What is the hot setup for a plug-and-play radio for use with these? I have modified a couple of commercial radios and am having some problem with the audio. I did direct discriminator/modulator connections.

I still need at least one more radio for testing and would prefer to use my check book and not my soldering iron for this one if there's something good and not too over the top in price.

Tek radio? Ramsey kit?

I realize that many radios can be made to work but I am looking for suggestions on the easiest thing to do.

Has anybody successfully gotten a Ramsey FX-440 radio to work on 9600
bps packet? I would like to trade notes with anybody working on either
(a) the radio (it seems to have problems of its own), or
(b) getting it to work with a 9600 bps modem.

Items found so far:

(1) The signal at the "discriminator output" terminal of the radio is
    useless. Use pin 12 of the receiver IC instead.

(2) The modem output is much too large for the transmitter input. Put a
    voltage divider between the two. (This is with the new TAPR modem;
    I don't know about the g3ruh modem.)

It's very unlikely that the data containing 3 ^C will take it out of KISS
mode since the 3 ^C have to be preceded and followed by a 2-3 seconds
of total inactivity in order for the PK-232 to get out of KISS mode.

Actually, it's probably unnecessary. Voice users find listening to data
so unbearable they usually go away very quickly.

Chris Blackmon, N4VGK, asks:
>Has anybody tried mobile packet with a Tandy model 100? Just curious.

I haven't yet, but as soon as I can get my radio (Yaesu FT-411e) hooked up to my MFJ 1270b TNC, I'll give it a try. I know there is a Model 100 program on CompuServe, and I have a modem cable that I know will go between the TNC and the 100. I'm having trouble getting the cable between the radio and TNC working without interference. (First I had nothing passing between the radio and the TNC; then I had it receive okay, but not activate PTT; then I had PTT work, but there was so much interference passed from the TNC to the radio [at about S7, and confirmed by moving the cable nearer and away from the radio, then shutting off the TNC].) Give me a yell in a couple of weeks, because I'm deep in a book project, and don't have a lot of free time right now. I think the 100 and an HT, if I can get the TNC battery powered too, will make a hot little portable packet system. I think 73 had a similar article last year.

I don't know about that Bill, the key point is the 1-2 second pause after
the three ^C's, and the KISS protocol itself ensures that no valid frame
can end in ^C

Terry

There's quite a number here in Sydney, due to some commercial "RF Packet

Modems" (KPC-2400's with different EPROMS) being unloaded at rock-bottom
prices. We've put a 2400bps port on the VK2RWI BBS here to cater for them.

>(a) the radio (it seems to have problems of its own)

I recently built one of these things. When I looked at it on a
spectrum analyzer, it was obvious that the design has a real problem
with low frequency parasitics. Adding some bypassing on the 8V lines
helped a little, but not completely. Another problem is
intermodulation inside the MC3335 receiver that feeds back some spurs
at +/- 21.4 Mhz into the transmit chain. (Pull the '3335 and the
transmit spurs go away.) This can be helped a bit by modifying the
front end to run off of the 8V receive switched bus instead of from
unswitched 8V. But I haven't yet cleaned up the radio to my
satisfaction.

Hello all,

How can i do to have - NOS - for UNIX station ?
How to install it ?

I read tcp-group messages with ftp and i read the newsgroups
 (when they are not filter).

Please, answer to me directly, many thanks.

PS: I send this message in packet-radio too.

Yes, I also think so. Try to speed up the CPU (not the interface chips!).
 For speeding up, you'll have to add an Xtal for the CPU and be sure that
the CIO is still working on the old speed (for the timers). The biggest problem
might be the synchronisation between the CPU and their interface chips but I
think this problem is already solved for the SCC in the PK232.

73 es gd luck
   Ralf, DD2kZ

PS: If these informations are not sufficient. I can look up in the German
PR Mailboxes for getting a full description of the necessary mods.

I was working on a TAPR 9600 modem last week, and came across
a problem. I thought I'd see if it was a common problem with
a workround, or if we were just unlucky..

Symptom:
     RX fine, TX non-functional, the transmitter was keyed, but
     the signal was rubbish.

Problem:
     It looks like U22d, the last op-amp in the tx data path, was
     was oscillating. U22 was a TL274 (ie, it was after the errata
     that changed the chip type).

We will swap out the chip, on the assumption that it's bad, but I
thought I'd ask if anyone else has seen this problem..

Me too!!!   A friend of mine and I are trying to hook our machines together,
probably with a 9600 baud 10GHz SLIP link. We are looking for stand alone 9600
baud modems that would work with a gunplexer. Higher speed would work, but his
serial port can't handle more than 9600.

Does anybody know the address for TAPR?

Thanx and 73's

I have been playing around with the JVFAX program (ver. 5.0). Does
anyone know how the SSTV settings in this program (e.g., B/W, 8 sec,
color, 96 sec, etc.) should be set for the SSTV I run into on, say,
40 or 20 meters? It's a bit frustrating trying the 8 or so
combinations, waiting for somebody to send a new picture each time!

Also, I'd appreciate hearing of good frequenices for SSTV and
FAX (weather photos and news photos). Thanks and 73.

To the person interested in linking a repeater system for packet
over 6 meter from NJ to FLA. I have some information from a
interested repeater owner near Asheville NC who is in the process
of installing a linked system on 6m with an antenna height of 120'
atop a mountian. (This will be a wide range rpt). He is interested
in becoming part of the link system to support a large part of NC
and SC (possibly other states). If you will email me at sampson@cs.unca.edu
and leave your email address, I will send this particular ham's address
back to you. Thanks.

I was active on packet a few years ago, but drifted away due to time constraints. Now I've got a research project which requires a radio link, and packet looks like the way to do it.

We're researching applications of the Global Positioning System. One of the things we're interested in is "differential GPS," in which an accurately surveyed reference station broadcasts real-time corrections to the GPS signal for nearby users. The data rates required are compatible with 1200 bps packet.

First question: Is this legal to do on amateur packet radio? It seems to me that it is. The bands /are/ for experimentation, after all. It's university research, sponsored by the FAA. No one is making a profit. Everyone running a transmitter will be a licensed ham. (The rest of the group is currently studying for "codeless technician" licenses--technological literacy is not a problem here.)

I've concluded, after some thought, that this is a legal and appropriate use of the amateur bands. If someone has a different opinion, I would very much like to hear it. Email, please; I don't want to start a flame war.

Second question: What band and what frequency should we choose? (Or, How do we do this without making enemies?) When we turn the differential station on, it will be broadcasting packets almost continuously for several hours. We only need a few hundred milliwatts to cover our experiment area, but the frequency will be unusable through most of Palo Alto (as a guess). I'd thought about 220, but ...

We want to put a differential receiver in a (large) radio-controlled model airplane. For related projects, we'll eventually want to send telemetry from the aircraft back down to the ground. Because of size and weight constraints, the best radio for the job seems to be one of the new miniature twin-band full-duplex HT's. (We're looking at ICOM's IC-W2A.) That pretty much restricts us to 2m and 70cm, because they don't build those HT's any other way.

Any suggestions for uplink and downlink frequencies? My current idea is to put the continuous uplink below 440 Mhz, possibly in the

ATV channels (the HT will receive the whole UHF band, but only
transmits 440-450). The downlink, which will be intermittent but
audible over a wide area, must then be somewhere in the 2m band--but
where? Any suggestions would be most welcome.

Unrelated question: While scanning packet ads in the last few days,
I've seen mention of 9600 baud modems which "won't work with all
radios." Can someone enlighten me about these? They don't seem to be
the same thing as the satellite 9600 PSK modems. What are they, and
which radios will they work with?

Thanks in advance!

Hi !

I use BayCom and a self made 3105-modem for packet on 2m and 70cm.
Now, as my main computer is scheduled to run ISC 3.0 24h a day, I
tried to get BayCom work under VPix, but with no success.

Does anybody know if it IS possible to use BayCom with VPix on ISC3.0
and if, how ... - I also use FAS 2.09-Async-Driver, and a AST-4-port-card.
I tried to setup baseaddr and comirq like I died under DOS, but it didn't
work. l2 loads correctly but without the cursor in the upper right corner.
SCC also loads correct but I can't send or receive data from the radio.

Any hints ??? - Thanx in advance !!!

73, Pat, DD6PF.

I have a AEA PK-232MBX for sale, used on my SW receiver for
FAX, RTTY and the such. Works fine, docs included (as good
as AEA ever made them), and cable to connect to your computer.
The firmware is release 31.OCT.89 (chksum $E3). Also I have
the older version of the FAX software. And the AC power
supply. Ok, no more.....

Asking $259.00

Call Dana or amail.

Hi, I am interested in setting up a BBS so that people can call up
my machine and download the latest utilitys that have been written/donated.

I was wondering if anyone could point me to a good BBS program? Either
commercial or PD, it doesn't matter to me. I am big-time ignorant as
to what to look for and where to look.

Thanks in advance to anyone willing to spend a second or two and
enlighten me. :-)

I am currently trying to obtain a relatively inexpensive news feed in

Dubuque, IA. I haven't been able to find anything available locally
over phone lines because Dubuque doesn't appear to be close to any
part of known civilization. I would use UUNET but I am looking for
the full feed and even their 800 number rate could get out of hand.

1) Is packet radio an option for news and e-mail?
2) Is there someone or something that can explain how to do it?
3) Is access to Internet e-mail, ftp, and telnet also available?

Please respond via e-mail
Thanks in advance

JAH>If you find a way to get BPQ to reliably run in a
JAH>window, I'd like to hear about it. 73 de John WA0PTV
Use QEMM's loadhi to load BPQ into high memory. You can use
Optimize to set it all up for you. You should allways load
bpq before DV, otherwise your DV task's will not be able to
interface to it properly.

I've got a couple of questions maybe someone can help me with:

  1) Anyone have an address/email/phone for TAPR?

  2) Are there any problems with the MFJ-1270B TNC? This appears to be the
     least expensive one I can find.

  3) I've got an old crystal mobile radio - a Regency BTH-201. I need
     somewhere to get crystals for it - ideas?

  4) I've got a NeXT computer which runs BSD Unix. I'd like to run Ka9q
     on it, but all I've found is a sysV version. Anyone got this
     working on BSD unix? (I really hate to have to dig out my dos box...)

  Thanks!

Hi! I have an AEA PK-80. I do not have the AEA manual for it. It is

currently running the 1.1.2 firmware from AEA. I need to know how
compatible is it with the TNC 2 design from TAPR. Can it run the
TAPR ROMS? or has it been enhanced so I need to get updates from
AEA? I am trying to bring up the TAPR 1.1.8 PROM up.

Thanks,
Ron

Until recently, I was running a W0RLI PBBS using BPQ, DESQview and QEMM.
All the TSRs (G8BPQ, and MB handlers) must be loaded prior to opening
any DV windows. My understanding is that if you are planning to use DV
you must inform BPQ via the configuration program.

I upload to /hamradio/packet/tcpip/incoming the hapn4800.arc .
It is the HAPN 4800 modem. The document is in Dutch .
The .PRN can be print to a Epson printer.
I do not know German but as I can see it needs mods to T/R as K9NG/G3RUH does.
Has anyone more info on this modem or any expirience ?
Any info about board availability , English docs , cost ,
compares to K9NG/G3RUH .

[stuff deleted]

For all those accessing imbrium.geo.brown.edu... yes it is anonymous FTP, but since I allow uploads it's a little picky about the E-Mail address. When it asks for the password one only has to type in his/her userid (i.e. 'robinson') and the @ sign... i.e.

imbrium.geo.brown.edu> login anonymous
331 Guest login ok, send e-mail address as password.
password: robinson@

That's it... sorry the FTP server is so picky, but I'm trying to provide a useful service i.e upload/download privileges, while *trying* to have *some* security... note that this "password" system can still be circumvented and I know that.   ;->

Sorry for any hassles, but it's worth it!

Regards, Darrin, N1LLV

I haven't been able to follow this group in the past few months so please
excuse me if there has been discussion on this before.

Has anyone here had first-hand experience with the L.L. Grace DSP-12 modem?

What other (if any) DSP-based modems are there on the market now?

In all this information that we apparently seem too stupid to see does it
provide any on how to use the ether for amature telecommunications? Can I
put a modem across it and get internet connection? The baud post seems
to so indicate. Hell, 56Kb will support me in my fantasy remote mountain
valley far from the madding crowd.

If you snag this please email me a copy too.

Thanks,

Bob

There is AEA's DSP1232 (soon to be available in stores) and the fully dual ported version the DSP2232 which is available in stores (at least in the US) now.

After you buy all the options which make the DSP-12 support downloadable new code, the package of source for the host code (no documentation except minimal supplied by others, not LL Grace), the DSP-12 and the DSP-1232 will be the same price. You will not get source for the host code with the DSP-1232, but you wouldn't want it. It is for the HD64180 and only Steve Stuart, N6IA, AEA's wizard has been able to get that thing to hum. I wrote the DSP code for the DSP engine in the AEA product.

Subject: macintosh softkiss vers 1.2.1
Lines: 15

SoftKiss is an init/cdev/driver that drives a ham radio
modem from a macintosh. It gets your mac on packet radio
without a tnc. Softkiss can use poor mans packet modems
from the IBMPC world. This is version 1.2.1. The previous
version was an application which required multifinder. This
version is an init/cdev/driver that can run under finder or
multifinder on any mac system 6.x or 7.x.

Softkiss is available from internet host akutaktak.andrew.cmu.edu
[128.2.35.1] as /aw0g/softkiss.1.2.1.hqx. It is also on compuserv
hamnet sig

NET/Mac is also required. It is available from the same archives.

BT

1. I need information about new HF formats for digital
communication. I have heard about CLOVER and PACTOR. Anyone
with knowledge that might start a discussion.

2. A compairson of the L.L. Grace and the AEA DSP machines.
Which one will "learn" new formats the best or at all.

I have acquired the latest version of Lan-Link, and have set it up
as the documents suggest. I used Packratt II to set parity to none,
word length to 8 bits and Tbaud to 1200. I could not find any indication
in the 232 docs as to how to set the stop bit. I assume the 232 is set at
1 as per the op. manual (page 2-7). I installed Lan-Link using the same
parameters - and was unable to get any response from the 232 when commands
were sent. In fact I had to pull the battery jumper a number of times
in order to reset the 232 in order to get Packratt II to communicate to
the 232 afterwards. Once or twice in Lan - Link I did get the 232's request
for a "   * " to be typed for the auto baud procedure - but in doing so
in lan-link - the 232 did not respond (typing only * as well as F
9 and

*). Is there a command or procedure I'm missing - I've followed the
rec's in the lan-link doc re battery etc. Comments abnd suggestions
would be welcome. Please E Mail to SEELER@UPEI.CA. I will summarize
responses.

dgilmour
From: dgilmour@osc.COM (David Gilmour)
Newsgroups: rec.radio.amateur.packet
Subject: More ARP questions
Keywords: ARP TCP
Message-ID: <5670@osc.COM>
Date: 11 Jul 92 07:34:53 GMT
Organization: Versant Object Technology, Menlo Park, CA
Lines: 22

Thanks to those who pointed out that ARP PUBLISH was the way to help me
use a second PC, with no TNC, connected via SLIP to a PC with a TNC, both
running NOS. Indeed, when I ARP PUBLISH the IP address of the non-TNC
machine and associate it with the AX25 callsign of the TNC-equipped PC,

then the machine with the TNC does indeed intercept packets destined for the IP address of the "off-air" PC. So far, so good, except...

The only way I have successfully made connections from the non-TNC PC is to do an "ARP ADD <off air IP address> AX25 <off air link (AX25) address>". This overwrites the "ARP PUBLISH <off air IP address> AX25 <on air AX25 call>" that is needed to respond to further ARP requests. From my perspective of relative ignorance, it seems quite reasonable to want to publish one address resolution ("map this IP address to my machine with a radio") yet act on a different address resolution locally ("now that you have the data, send it along the SLIP link"). But this would require that ARP PUBLISH and ARP ADD would simultaneously be supported for the same IP address, with very different semantics. Clealy this is not the case in NOS, so I must be doing something wrong.

Sorry for the convoluted explanation. Can anyone help with a workaround?

They're on nic.funet.fi in /pub/ham/amiga called ham[123456].lhw

As an earlier poster pointed out, they don't seem to unpack properly.
However, if you use a program such as "FixDisk", you can retrieve all
the data on them. They're quite old - circa 1988.

I'm completely clueless about packet, I'm just an SWL investigating how
to hook up my Amiga to radios. I'd appreciate any Amiga owners out there
letting me know about their software/hardware setup.

Regards,

Here's an example from my autoexec.nos which routes and publishes for a
unix machine connected via ethernet. I've used the same seteup for slip
links, as well:

```
------------------------------
# COM1 -- 256 byte MTU, 2400 baud
attach asy 0x3f8 4 ax25 vhf 2048 256 2400 [44.70.12.35]

# using a weird address for the ethernet card
attach packet 0x60 ether 5 1500
ifconfig ether ipaddr [44.70.200.200]

# You need at least one routing command; if your only radio is on vhf,
```

```
# this'll do it.
route add default vhf

# now we route to unix machine
route add 44.70.12.34 ether
arp publish 44.70.12.34 ax25 ag9v

The unix machine needs to have a "route add gateway" statement telling
it to route everything out the ethernet to [44.70.12.35].

With this setup, you're in business.  Note a couple of things:  NOS
supports a separate ip address for each interface; that's the standard
way things work in the real world.  Using a separate address for each
interface makes things logically cleaner, but there's no absolute reason
the vhf and ether interfaces here couldn't have used the same address.
It's just a matter of telling the unix box where to send its packets.

Since the ethernet address [44.70.200.200] never shows up on the air, I
just grabbed it at random.  You <do> need to have at least two addresses
on the system, of course;  one for the gateway machine, and one for the
hidden machine.

Hope this helps...

I have problems with the BAYCOM software (ver. 1.50a). After having connected to a remote node, I receive one packet and then, after some delay, get disconnected. Other people don't get disconnected; myself I had no trouble working PMP with the same node. I suspect that my software doesn't send something (RR packet?) and the connection just times out. In my SCC.INI I have the <maxfram> parameter set to 1...

Here are my questions:

1. Can anybody refer me to the version of BAYCOM which WORKED FOR HIM (I can FTP it easily if it's posted anywhere);
2. Did anybody see a manual for the version 1.50? I'm using the manual from ver. 1.2 I think, which doesn't mention many entries in my SCC.INI file;
3. Any hints in this particular problem?

Thanks in advance, Marek vk1kam

Hello all,

I am posting this for a friend.... Please don't reply to this address...

From: pe1nat@pe1nat (Ed)
To: pa2aga%pi8hvh@pi8yrc
Subject: tm531 <> 9600bd mod (prdigest)

To use the Kenwood TM531 with a g3ruh 9600 Baud modem:

1. PLL-unit modifiation:
   Change R56 to 3k.
   Change C56, 57 to 10uF/10v.

2. Main board:
    Remove C55, 70, 118.

3. TXA:
    TXA via 150k to MO (pll-unit).

4. RXA:
    RXA to pin 12 ic2 (main board).

5. Change C34 (ruh board) to 1uF (mkm).

6. You'll need a eprom COA.

7. Solder a ptc (siemens b30-0845-05 (60 Gr. Celius)),
    on the VCO-unit.

Let me know if your work is also succesfully...

73's, Ed. pe1nat.

I just won a Data Engine this past weekend.  Lucky stiff, right....
Anyway, am looking for access to the KA9Q DIGEST, which i understand
has some Data Engine appends in it.  Any other info that might be
useful would be much appreciated!  Feel free to email to me at
N4TY@LEXMARK.COM also.  Thanks, tyler.

Someone mentioned that there was a recent article in 73(?) that covered connecting several TNC's to various HT's. Does anyone know which/when?

I have been trying to get my HTX-202 working with an HD-4040 TNC. I have gotten mucho help from the net after my previous posting for help. A puplic thanks to those who helped.

The problem I have is that the HTX-202 won't key up with anything larger than a 2.2K resistor and that seems to attenuate the signal too much. One of the nice gentlemen who helped me out mentioned a possible alternative to the resistor, but I thought that if the above article DID cover this particular issue I could save some trial and error time.

Simple question for all of you. I'm just about to get started in packet radio. My dad is just about at the point where he is just about to send pains of

change through his body and use his computer in conjunction with his Kenwood TS-440S. :) Therefore, he is very green on this subject and most of the people he knows don't delve into packet either.

I was wondering what people suggest for just starting out. I have a very good background in computers and networking so feel free to be as technical as you want.

I'm going to be running this thing off an old Apple //e and primairly an IBM compatible.

My basic questions are:

1) Is there really any significant differnces in the commands used to run the different TNCs by Kantronics, MFJ, and AEA? or do most programs work with any of them? Is there enough differnce to justify the cost difference? Be specific please.

2) I was thinking of skipping the multimode data controllers... Is this wise? Is there that much use of AMTOR and everything else to justify the $100? If so, what do they offer that packet does not?

3) I was thinking of the MFJ-1270B or the MFJ-1274. Am I correct that they are basically the same but the 1270B is missing the HF modem?

4) I am seriously considering a 2400 baud modem for it, I would assume that most out there now use 2400 baud? (1200 is to darn slow in my opinion.) Anyone have a percentage approximation? For now, I'll hold off with the 9600 baud modem.

5) what do you guys suggest for good programs to run the TNC with? I'm interested in general chat, mailing, but also running TCP/IP over it.

If you have a better idea where to get information, just yell... And thanks for your time!

Some time ago someone posted a note about running BAYCOM on a MAC which
was running SoftPC. I confirm that BAYCOM wakes up. However, the poster
failed to note how he/she was making the connections to the outside world,
since the MAC doesn't support things like CTS, etc in an obvious way.

Would the previous poster please contact me via email regarding if they
managed to get BAYCOM completely up and running?   Thanks much.

The 1270B has an HF modem but lacks the HF tuning indicator.  Aside from that,
I think they're the same TNC.

Most of the 2M packet stuff I see around here is still 1200 bps;  I don't
really know:  Is 2400 (or above) legal on 2M?

[these comments apply to AmigaNOS 2.9b (I think that's the most recent
version)]
```

I obtained the latest version of AmigaNOS from ucsd.edu, hoping that the most recent version corrects some problems I've been observing.

Unfortunately, it doesn't, but they're not fatal, just annoying.

First off, when AmigaNOS exits, it forgets to free one signal. Easy fix -- just include the call to FreeSignal, which I've done on my own private version. (I spotted this with the help of WShell 2.0 -- if you program on the Amiga and don't have this, for shame! Run right out and buy it.)

Second -- Why is the serial port being opened with SERF_RAD_BOOGIE? This is only necessary if you're doing MIDI (or, I suppose, 56K packet). The code includes a /* ? */ comment when it sets the flag, so I guess the person that ported doesn't quite know why it's being done either. The SERF_RAD_BOOGIE flag disables some internal checking -- I removed the flag, and it seems to work fine (but then, I only used it at 9600 baud -- hardly MIDI speed).

Third: I had no end of problems getting AmigaNOS to work, until I noticed that I only seemed to have problems when I used a port on my A2232 7 serial port board. When I used the built-in serial port, everything worked great. Specifically, it looked like the serial port wouldn't send anything to the program until some buffer overflowed. Anybody else have experience with this?

Fourth: It would be nice if instead of opening windows on the workbench, it would open them on the default public screen. This is an easy fix as well -- set the PUBLIC_SCREEN bit in the NewWindow structure. (well, that may not be EXACTLY it, but it is simple. This is another fix I've done privately)

Fifth: (This is merely a peeve) It would be nice if AmigaNOS used the Amiga's inherently multitasking OS instead of the internal task switching hack (not an insult) carried over from the PC. Looking over the code, this looks like a major task for anyone without intimate familiarity with the NOS code (which I, regretably, don't have), but I believe it would clean things up immensly.

Sixth: (this is pure blue sky) Re-writing the various pieces of AmigaNOS as a full-blown AmigaOS device would be very cool -- Any extensions can then be distributed as stand-alone executables, without the hassle of recompiling the entire NOS executable just to add a little bit of functionality. I think this has been brought up before.

Anyway, AmigaNOS is, in general, a very fine program. Hopefully some of my suggestions can be incorporated into the next version.

(Of course, this is meant for g1yyh (I think that's it) in specific, and the net in general. I would have sent it directly to g1yyh, but all I have is a packet address)

You have to do an explicit 'start ax25'. This starts the ax25 mailbox
listener. The command should probably be renamed to 'start mbox' although
there may be historical reasons for it being the way it is now.

I keep seeing people requesting information on mail gateways to amateur
radio packet, but as of yet I have not seen a single answer. I have
heard rumors of a system called GRIP in Michigan that allows for IP
access to the U of M weather server among others, but I have not seen
anything from it in regards to whether or not it handles mail.

So I ask yet again:

     Are there any mail gateways from internet to packet out there?

Thanks - S. Wood WQ8B

Question for NOS wizards --

I have two PCs -- the main PC runs 24hrs, has a DRSI board, and is running
NOS. I would like to hide this PC, remove its monitor, and control it
remotely from a second PC. This second PC is connected via a serial line
to the first PC, and I have NOS running between the machines using a SLIP
connection.

Both machines have published IP addresses, but of course only one is connected
to a radio. My problem is that when I initiate connections from the second
PC, routing through the first as a gateway, none of the returning packets
know to use the first as a gateway since it does not appear in their routing

tables. As a result I cannot connect.

Is there a way to force my main PC to intercept packets for my second PC's IP address and forward them on? Or some other feature of NOS that addresses this situation?

Thanks in advance --

Here is a copy of a posting I made on rec.radio.amateur.misc,
also please read the FAQ #3 in rec.radio.amateur.misc

You posted a reply to an article with the following comment:

>
>   Yes, but there are LOTS of people who cannot use FTP for various
>reasons (I am one, there must be others!).
>

This is not true. Even if you do not have direct access to FTP you
can still use FTP. Let me explain. There are special servers out
there that accept FTP command files as e-mail and will execute the
command file for you. One such site is "ftpmail@decwrl.dec.com".

First you should send an e-mail with only "help" in the body of the
message. It will then send you back a list of detailed instructions
on how to use it.

One note, for binary files you need to request the server to uuencode
it for you before sending it. Then when you receive it you will need
to uudecode it back to a binary file. This also means that you will
need the executable uudecode. Check and see if you have this command
available at your site, if not then let me know and I will see what I
can do to get you a copy.

FTP mail servers are a blessing to those who only have e-mail access.
And they work pretty good. There is some time delay and it's not as
neat as having real FTP access, but it makes a pretty good second.

Happy FTPing,

--

Just as a general note, and not directed at anyone in particular:

If you're thinking about running OS/2, don't do this. While DOS doesn't use
the printer interrupt, OS/2 does, and (at least on an ISA machine) you can't
share interrupt levels between more than one piece of hardware.

BTW, this isn't restricted to COM ports; the default interrupt for the
Soundblaster card is IRQ 7, which is the same as LPT1:; a common problem for
new OS/2 users with Soundblasters is that they can't print...

There's not much you can do other than to comitt surgery on the

braindead design of an IBM PC. The problem is 1/3 and 2/4 share
the same interrupt. Any code that uses the interrupts (and most
PC code doesn't seem to) is going to have fun using 1/3 or 2/4
at the same time.

 Per Kantronics, none of the KPC line, or the KAM, are capable of
operation at anything above 2400 baud radio port speed. They use
the processor to do too much and it runs out of steam.

--know to use the first as a gateway since it does not appear in their routing
--tables. As a result I cannot connect.
--
--Is there a way to force my main PC to intercept packets for my second PC's
--IP address and forward them on?

One way that would work is for your gateway PC to do an "arp publish" using
your hidden machines' IP address but the gateway's callsign. Then when
some station arp's for your IP address, the gateway will respond, get the
packet, then figure out how to forward it to you.

Cheers,

hi folks...

     One of my friends, WB4FQB (Ken Crump) is having troubke setting up
     a packet station. He is using a new Kantronics All Mode TNC
     (ROM v5.2)attached to a new Gateway 386sx. The combination works
     in terminal mode, but just stares at us in KISS mode or when
     using NOS. We tried replacing the ROMS with v5.0 with no luck.
     Another Kantronics TNC (known good) was attached with the same
     results. Assuming that the documentation is correct, the cables
     are wired correctly. Swapping comm ports doesn't help.
     Long-time packet operator K4OLC (Lin Couch) is baffelled.

     If I sound dazed and confused, I am. Waht I know about packet
     would fit in a very small thimble and still leave room for
     a finger. Any thoughts or suggestions would be greatly appreciated.

thanks much...

I asked for as many gateways as anyone knew, but, I only recieved a reply from one person....here it is:

----If---You---Cut---Here----you---may----damage---your----screen------------

How to Use the wb7tpy.ampr.org
Internet <-> Amateur Packet Radio Gateway

From Internet/Usenet/Bitnet/Fidonet to Packet:

Send email to "gate@wb7tpy.ampr.org" on Internet or "gate at 1:114/15"
     on fidonet.

The first line of text must be:

Packet: user@callsign.hierchial.address

ie

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet/Usenet/Bitnet/Fidonet:

send email on packet to "gate@wb7tpy.az.usa.na"

The first line of text must be:

Internet: user@site.domain

Any questions can be sent to:

wb7tpy@wb7tpy.ampr.org (Internet)
wb7tpy@wb7tpy.az.usa.na (Packet)

If you have an application hang, you can always abort it. (System 7 has
Command-Option-Escape, which forcibly aborts the current application)

Agreed.

I always liked my friend Chris's CP/M machine. That sucker would boot
within 1/64th of a second of hitting the reset switch.

Does anybody know what equipment I should but to get started in packet?
I would like something that is compatable with AX.25, CW, TCP/IP, can possibly be used portably
and can achieve speeds of 2400 or greater. Also, where can one find about TCP/IP frequencies etc in their area (Long Island)?
Is it posiible to run a PBBS on any of the TNC's on the market today?

Thanks,

 David Dorkin (didn't get my call letters yet)

>
>So I ask yet again:
>
>   Are there any mail gateways from internet to packet out there?

The gateways exist. Not all of them forward e-mail from Internet to packet.
Most will forward packet mail to the Internet. Almost all of them, except for
the mail-only gateways, link disconnected portions of AMPRNet (net-44,
ie. 44.x.x.x) using TCP/IP. Roughly half of them allow digipeating of plain
AX.25 and Netrom packets to other gateways. Some gateways allow
telnet(mailbox)/ftp access from the Internet.

At last count there were 24 gateways. Two of them in Europe, four in
Australia, and the rest in Canada and the U.S. And the list keeps growing.
I haven't kept any records but would guess that on average a new gateway
appears once a month.

Because of various concerns for security you will not find many of the gateway
administrators advertising their systems on Usenet. However, the FAQs mention
a mailing list for gateways. The mailing list is restricted to gateway
administrators, those who are planning on setting up gateways, and other
folks who have a 'need-to-know' (eg. FAQ editors). To get onto the mailing
list, send a subscription request to gateways-request@mpg.phys.hawaii.edu
stating your name, callsign, and the nature of your interest (ie. one of the
three categories I mentioned above). Subscribers are requested to keep
information from the gateways mailing list confidential.

Those interested in end-user access information may also send inquiries to the
address above. Generally, the individual will then be directed to his/her
geographically nearest gateway for further questions by the administrator(s)
there. Alternatively, one can send directly to the mailing list
(gateways@mpg.phys.hawaii.edu) and hope that one of the sysops responds. To
expedite the process, end-users should provide their full-name, callsign,
geographic location and a 'good' e-mail return address. There is NO guarantee
of access to any of the gateways - just that someone (usually me) will try to
answer an inquiry as time permits.

--Mark, N5XYV asks about packet radio on the Amiga.

Currently, AmigaNOS is up to about version 2.9c (?) for those of you that
want to run TCP/IP. I have not seen a lot of other software for the
Amiga dealing with ham radio. Somewhere out there there is supposedly a
public domain disk with a bunch of ham software on it. I run a terminal
program that I wrote in AmigaBasic. It does what I want and it is tailored
for operating with the PK-88 and PK-232. It is fast enough to handle
1200 baud packet, but just barely. One of these days I will have to write
one in C (sometimes a daunting proposition on the Amiga :-( ).

     I've had a license for 37 years. I've spent the last 10 years designing
     building and managing computers and networks. I deal with this stuff
     8 hours a day. I certainly am not going to go home and do it some
     more. I can be heard TALKING on 10/17 in the winter months when its
     too cold to go fishing. -Roger

The coordinator is Don, KA1MF in Harvard MA. I don't think he has internet access so you need to contact him via his callbook address or AX-25 vie WA1PHY. If you have difficulty, let me know and I can help.

I don't know what the Alinco DJ-580T is but your best switch might be the Stoneham repeater on UHF.

Hi folks,
in a recent article by a VE7 station I read that the G8BPQ node switch
will now support 62/64 users with the PacketCluster software.
Being quite unhappy with the DRSI-Cards and drivers I would like to obtain
more info on this.
I just downloaded BPQ405.ZIP from W3IWI's server, but the file cluster.doc
says it will work with 32 users only.

I heard of a version 4.05B, maybe that's it ?

By the way, if any other PacketCluster Sysops read this -
hopefully within a few weeks we'll start a new mailing list
dedicated to PacketCluster Sysops,
still looking for the mailserver-software...
I'll do another posting to let you know!

I thought remembered a few months ago, someone posting an article about using
the HP-48SX calculator on Packet. I can't rememeber any of the details,
though. Could someone please post or e-mail me details of this....It sounds
interesting enough to give it a shot.

Oh, one more thing....also tell me if this is all just a pipe dream..

Thanks to everyone who replied to my previous questions -- it seems like I am
not going to get 9k6 on my KPC2!

So, another way of making things a bit faster occurred to me. I am away from
my TNC, at work all day. Then I come home late at night, as do many others,

and we all go on air at the same time. Result? The channel gets saturated.

However, while I am away at work, there are still quite a few amateurs in the area accessing a local BBS and reading bulls. So, I am considering writing a program which will watch all these bulls whizzing past, and grab them into the PC's hard disk. Effectively, then, a cache which will store the messages read that day by anyone in the area. And I guess that if that works I would add a feature to let it grab any uncached bulls at, say, 3pm before I return from work. The point is that it would not need to download as much by itself, because it could `listen in' on the bulls being read by other hams.

Does anyone have any thoughts on this? Good idea? Bad idea? Already been done?

Thanks and 73s
/atp

Speaking of KAM problems...

I run my KAM at 4800 baud (using DESQview, and since the computer is going
away soon there's no point in hacking 16550s into it to run it at 9600 baud).
I've found that, with the 5.02 ROM, the KAM hangs when I exit KISS mode.
Specifically: it prints the "cmd:" prompt, accepts a command, but does not
execute it. Instead, it just goes into dumb echo mode. Cycling power makes
it work again, but since I PERMed it into KISS mode that's how it comes up and
I can't get it out except by using the selftest/reset. This does not happen
at 9600 baud.

Anyone else seen this? Any suggestions (aside from (1) call Kantronics and
(2) "then don't do that!", both of which are obvious)?

++Brandon
(P.S. (1) won't necessarily get me a solution in a timely fashion and (2)
isn't necessarily going to help, especially since I can't run it at 9600 on
this hardware.)

+---------------

Considering that this is exactly the way the pacsats work, it's somewhat
surprising that this isn't done on terrestrial packet.

(Note: I doubt the programs for use with the pacsats would work for this,
I think they format messages a bit differently. I may be wrong about that,
but *certainly* the code to request specific bulletins won't work.)

Catching up on mail...

The only TNC that I know of that will run at 9600 (by Kantronics that is) is the DataEngine. Kantronics TNC's do the HDLC in software and the CPU is just too busy and too slow to run at 9600. The maximum that one can run is about 3000 bps. They do just about everything in software, as oppsed to other TNC's (AEA, MFJ, Paccomm, etc...) that do HDLC in hardware and have no problem at 9600. This has been confirmed several times by several Kantronics engineers when I tried to put a V29 modem in a KPC-2400, KPC-4, and KAM.

Also for those with PK-232 without the mailbox board, 9600 runs a lot better with the old 1987 EPROMS.

Another note. There is a difference between baud and bps (bits per second). Baud would be the modulation rate while bps would be the transfer rate. I believe a G3RUH type modem is 9600 baud, but when you get into QAM or PSK, like the V29 9600 modems, that is a 2400 baud modem with a 9600 bps transfer rate (uses 16-QAM). 4800 8-PSK has a baud rate of 1600 hz. Think the FCC can swing this for 10 meters! Wouldn't PSK on SSB work better than FSK on FM ? We've talked about trying this with the V29 modems for a while, but never got around to doing this.

>interesting enough to give it a shot.

I've worked down into the Carribean from the middle of the U. of Maryland
Mall with my portable packet setup, including an HP-48SX as a terminal.

Snag some terminal software, grab a null-modem and appropriate serial
cables (need one from HP), get batteries for your TNC and radio and
go for it!

Look at comp.sys.hp48 for info on terminal programs.

1.0 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, 2 amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have a packet Bulletin Board System (BBS) attached to their local packet network. Amateurs can check into the BBS's and read messages from other packet users on almost any topic. BBS's are networked together over the packet network to allow messages to reach a broader audience than your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSs. BBS's have the latest ARRL, AMSAT, and propagation bulletins. Many BBS's have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the

received messages. In addition, any packet TNC can be used a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBS's (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller)

A TNC contains a modem to decode the audio signals into digital signals. It also contains a modem and a micro-computer to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Most TNC's use 1200 baud for local UHF/VHF packet and 300 baud for long distance HF packet communications. For VHF/UHF packet, higher speeds modems are available, but often are harder to interface.

Computer or Terminal

This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio

For 1200 baud UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 baud data is used over single side band modulation. For high speed packet (anything greater than 1200 baud), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access) If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25 ?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

HDLC : (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

AX.25 : Amateur X.25 protocol. The basis of most packet systems. See section 1.7.

TAPR : Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

digipeater : A packet radio station used for repeating packets. See section 3.3.1 for more information.

digi : Short name for a digipeater

NET/ROM : A scheme for packet radio networking. See section 3.3.3 for more information.

TCP/IP : Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

KA9Q NOS : (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

NODE : A network node. Often a network node running NET/ROM.

KA-Node : A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

CSMA : Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

TNC : Terminal Node Controller. See section 1.5 for more information.

AMPR : Amateur Packet Radio.

44 net : The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format of 44.xxx.xxx.xxx .

ampr.org : The high level domain recognized on Internet for amateur packet radio TCP/IP.

RS-232 : (RS-323C) A standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

protocol : A standard used for intercommunications between different computer systems.

CRC : Cyclical Redundancy Code. The error detection scheme included in each packet. Verify that the packet was received error free.

KISS : Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

modem : Modulator/Demodulator. Converts the analog signals into

binary data stream (a series of ones and zeros) for the TNC or a micro-computer . First step in decoding packets.

FCC : Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM : Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

SSB : Single Side Band Modulation. The radio modulation scheme use for HF packet and satellite packet communications.

AFSK : Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

FSK : Frequency Shift Keying. A method of representing digital information by shifting the radio carrier different amounts to represent ones and zeros.

LAN : Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.
[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -Steve]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

> This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.
>
> Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand

filtered.

I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be pass FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to assure that rules of message content are followed.

It's my license if I send use packet radio illegally anyway, so what does anyone else care!

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensees responsibility, one illegal message sent over the packet radio network could literally jeopardize the license of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2.0 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup):
General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup):
General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup):
Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with polices of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup):
General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group):
A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group):
A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group):
A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list):
Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list):
Group discussion technical developments of TCP/IP over

packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (mailing list):
Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu
Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information.

wsmr-simtel20.army.mil
Very large collection of amateur radio software.

wuarchive.wustl.edu
Mirror site of Simtel20 archives. Unix directory structure - Easier to use then the simtel20 archive.

ftp.cs.buffalo.edu
Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov
Packet software including Baycomm, Rose, G8BPQ, NOS, etc.

2.3 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:
1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie:
   SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL
3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.ps.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur callsign and their Internet address.
2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.ps.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3.0 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the

digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM as if connecting to any other packet station. From there, he can issue the NET/ROM commands to instruct it to connect to another user locally or connect to another NET/ROM. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM don't use all of the AX.25 protocol. Instead, they use special AX.25 packet called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, often unreachable nodes are entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater maintenance times.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBS's use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBS's, many TNC makers have developed Personal BBS software to allow full service BBS to forward mail directly to the amateurs TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

Presuming this gets to the proper list: I am having difficulty understanding

the capability of G8BPQ, DESQview, and QEMM. I need to understand if
BPQ will run in a DV window. There are frequent references to DV in the
program and to EMS. Thanks in advance. Dave (KN2M)

Hi folks,

I'd like to invite all Sysops of PacketCluster nodes to a new mailing
list _entirely devoted to_ to Dick Newell's PacketCluster Software.

What you have to do to get in it ?

send a message to listserv@ifsws1.sozialforschung.uni-stuttgart.de
with a message body of "help" - this is to show you the commands
this mailing list server supports.
Then, send a second message with a message body of
"subscribe packetcluster <firstname> <lastname> <(callsign)>"

so if you are Dick Newell and your callsign is AK1A,
the line would be:

subscribe packetcluster Dick Newell (AK1A)

Also I did open an anonymous FTP account on my machine to supply
PacketCluster-related software, information files and databases.

FTP to 129.69.162.1, login as "ftp", choose any password.

Then "cd /pub" - that's where the things are.
Feel free to upload files to /pub/uploads, don't forget to leave a *.txt file
to describe your upload.

73! Frank

Hi!

I'm in the process of buying a TNC for my (soon to be setup) packet station.
I've got a few questions:

     What would be the "best" TNC for 9600 baud and TCP/IP (using the KA9Q

software) operation?

I like the AEA PCB-88 because it's an internal TNC. Can this unit handle the above modes of operation?

Comments on any other TNC and/or software package would be welcome. I'm just starting out and want to get off on the right foot.

Thanks in advance.

In response to the question about running G8BPQ in a Desqview window, I've been playing with this now for several months. My arrangement is the AA4RE BBS ver 2.12, G8BPQ ver 4.05 and Desqview 386. I am currently using a DRSI card with two ports and COM1 with a DSP-12 attached to provide 9600 baud access to the board. Currently I run G8BPQ before Desqview. In fact, somewhere in the G8BPQ docs it says that there have been problems running it in a desqview window. I can confirm this. For the last two weeks I ran G8BPQ in a window and occasionally strange things would happen. Mostly, the problem is that someone would log into the board, get the sign on message, but then when it went to determine how many messages the user would see if he typed "L", it would just stop. The computer wasn't necessarily hung up at this point, it would just stop sending or receiving data from the user. Also from time to time I would have the computer hang for no apparant reason.

So I've gone back to running BPQ before desqview. This

unfortunately allows a good deal less memory for other
programs, but it does allow me to run other BPQ services
in other windows at the same time, such as CHAT and HELP.
If you find a way to get BPQ to reliably run in a
window, I'd like to hear about it. 73 de John WA0PTV

I have a few schematics for a few different packet radio modems not
requiriing a compiled modem to be built off of. These are cheap(from 10-
25 dollars) but runn only up to 1200 bps, and one set has the transmitter
and receiver in a different schematic. I have basic electronics background,
(I can do digital and anologue circuits with ease if the schematic is clear)

and wish to find schematics which entail radio modems of 2400 bps and above.
I would appreciate any information regarding where I might find such information

Thanks.

The PB protocol is designed for PACSAT for sending messages from the
satellite to the users. This is a *broadcast* protocol which significantly
reduces transmission redundancy, when more than one station wants to down-
load the same message.

This seems to work fine for satellites, but what about using broadcast
protocols like PB, for terrestial traffic also? BBS forwarding for example.
It is often frustrating to observe the forwarding between BBSes on HF.
The same BBS forwards to several other BBSes on the same frequency and
it have to send the same message to each of them.

I think that in cases where one BBS forwards the same mail to several others,
it can be done more efficiently by using a broadcast protocol.

Greetings, apologies in advance if this is a FAQ. Please feel free to refer
me to an FTP site -- i have looked for but not found the data i'm looking for.
I have no experience at all in radio. Next year I will be attending college
in annapolis maryland, across the street from a naval academy, which has what

was described to me as a "digipeater". Since i wish to stay on the net at school i have begun investigating packet radio as a means to internet access. Unfortunately, the documents I have found which deal with this topic are of a highly technical nature, only comprehensible by those with radio experience. Is there an introduction to this topic intended for people with internet experience but no knowledge of radio? If not, could some kind soul furnish me with said introduction? My objective is simply to get on the net via radio, although I've heard tell of many other wondrous things that can be done with packet. I am particularly interested in knowing what kind of money is needed to get xfer speeds of 9600 baud or above, how the routing works (i assume i would have my own IP address?), and whether the speeds achieved by radio are quick enough to allow for practical remote login.
Thanks in advance for your tolerance of a radio neophyte.

The document entitled "Beginner's Guide to TCP/IP on the Amateur Packet Radio Network Using the KA9Q Internet Software" is again available by anonymous ftp. The new location is ftp.eecs.ucdavis.edu.

Version 2.0 of the guide documents the use of NOS 911229 (PA0GRI v2.0h) and BM v3.3.2. The document is available in three forms in the directory pub/ka9q.

"nosbgnlp.zip" unzips to a 66 page ascii "line printer" document, which can be printed with the UNIX lpr command.

"nosbgnps.zip" unzips to a 54 page PostScript document, which can be printed on a PostScript printer.

"nosbgnpr.zip" unzips to a 66 page ascii "print" document, which can be printed using the DOS print command. You will need to send control codes to your printer to control the page offset and you should turn perforation skip off.

I am unable to provide access to this document in any way other
than anonymous ftp. Those of you who do make it available in
other ways (on a BBS for example), please let me know and I can
pass this information on to those who inquire.

Comments and suggestions for change to the document are welcome.

Like many hams, I enjoy scanning/monitoring as well. More and more, I
keep encountering non-amateur packet protocols being used for business
or other services. Most of the tones seem to be the same as amateur packet,
but just using a different packet format. Which brings up my question:

Why hasn't someone marketed a modem that demodulates the tone pairs,
then hands the demodulated binary off to software that breaks down
the packets. Such a company could then sell a single software package
that could interpret multiple protocols or different modules for
different protocols. The PMP modem everyone built (including myself)
does this, but I don't have the knowledge necessary to
to modify the software for other protocols.

Anyone have any constructive thoughts or suggestions on this?

They're not TNC-2 clones in that you can't plug in H/W such as 9600
baud modems and the like into them.

They are, however, a cheap way into packet. Reliable.

If it's of any interest, the Kantronics "RF Packet Modem" appears to be
just a KPC-2400 with a different EPROM (and manual, and labels). Get
the EPROM upgrade, and you're in business! I don't know what the "RFPM"
runs, but AX.25 it ain't.

Someone here in Australia was selling them real cheap, because they didn't
work with the local BBS's. Silly boy :-)

I do not believe this is correct. I believe the PK-88 has a standard modem disconnect. The PK-232 on the other hand does need a special disconnect header that is provided by TAPR in Tuscon, Az. for a small fee.

I am idly thinking of buying a MacIntosh Classic for use in the ham shack.

Questions:

    how easy is it to keep the Mac racket in the Mac and out of the Rcvr?
    Are there C compilers and assemblers for the Mac?

Any favourite station computers that do not use 80..*[68] cpu's?

>mee too. if there's no FAQ, can someone followup with a
>posting or email to describe briefly what this group is for?

Yeah, this newsgroup is for discussing how to can tomatoes.

No seriously, this newsgroup is also aliased to misc.misc.me.too, which
is a central depository for "me-too" postings. Paid Usenet employees
read this newsgroup and are required by net-regulation to research all
me-too questions and mail them to the original posters.

Lest someone accuse me of being TOO facetious (who, me?), I'll point out
that the FAQ is cross-posted to this newsgroup and news.answers (where
it still might be on your news sppol) and is archived at
ftp.cs.buffalo.edu under pub/ham-radio/faq_packet or at
pit-manager.mit.edu under pub/usenet/rec.radio.amateur.packet/(some
long name). Other documents of interest might include the general
amateur radio FAQ and the Elmers list.

Good luck. If you visit the pit-manager archives, check out
pub/news.announce.newusers. Feel free to E-mail me if you have any more
questions about amateur radio or the net in general.

I can't pass this one up... I've been using Macintoshes next to, and
with, my ham station for over eight years. Macintoshes are very well
shielded, especially the compact Mac models. I have demonstrated the
Mac running MacPacket(tm), with TNC-2s and other TNCs with a handheld
2 meter rig more times than I can count. The only problems I have
run into is that the TNC puts out lots of emi that bothers the radio
receiver. Turn off the TNC, and things are quiet. The answer, of course,
was to move the antenna away from the TNC... It is an interesting
experiment to move an HT around the computer in close proximity. You
will see some noise, but probably not too much.

I have noticed some problems with HF operation, but then I was using
a short piece of wire for an antenna. When the station is connected
to a decent external antenna, things are great.

The big reason for things being quiet is obvious once you open up
the Mac. They have shielding and emi coating everywhere. If everyone
did as good a job with shielding, there would be few EMI problems...

The modular Macs (Mac II family and LCs) aren't quite as quiet as the
compact Macs, due to having more openings in their chassis. Still, there
is plenty of shielding, and things are far quieter than most other
systems. The biggest cause of problems seems to be the CRT. Of course,
this is probably the case with most systems. It just helps to have it
inside the shielded cabinet ;-).

>Any favourite station computers that do not use 80..*[68] cpu's?

Well, my first packet station was built around a 6502. In fact,
it was probably the first dedicated packet repeater, way back in
1981. Still works, too!

I second what Jack said--they're pretty quiet. I just scanned the entire
2m band, and the TNC was the source of all the noticeable hash. It's been
a while since I've had an HF rig set up, but I think it was fine, too.
(Please note, of course, that my comments do not represent a guarantee from
Apple that your experience will be the same.)

(FYI, at the moment I'm running my packet station from a Mac Plus; the
2m antenna is acutally draped partly across the computer! And the Mac II
I'm writing this on is about three feet away from the antenna.)

>   Are there C compilers and assemblers for the Mac?

Of course! I know there are at least some from Apple (the MPW series)
and Symantec (THINK); there may be others. There are also some C++ compilers.

> Does anyone have info on the radio connections for using an Icom W2A
> with the PK-232MBX?

     Not exactly IC-W2A to PK-232, but I use my W2E together with a
     PK-88. I don't think they differ too much..

     You need four wires from the TNC: ground, mic, speaker and PTT.
     I cannot tell for sure, which wire is of which color, as the
     wire I had, is not necessarily the original. Anyway, you need
     to connect the speaker wire to the tip of the W2 plug, mic wire
     to the center ring, and ground to the base ring. Last, connect
     PTT wire to mic via a 10 kilo-ohm resistor.

     After that, just power up, check for smoke and on the air..

     It might be a good idea to turn off the battery saver on your
     W2. It still works with 1:4, but it works better when Off.
     Setting it to 1:16 is a bad idea, especially if the channel is
     not continuously crowded..

    I wonder, if this would be available somewhere via a mail ftp
    server or something for those of us that do not have ftp, but
    mail only access. (Yes, there are still lots of locations, that
    can not use ftp.)

    Anyone who could uuencode & mail the Postscript version, perhaps?

Nntp-Posting-Host: mpg.phys.hawaii.edu

I am posting the following message for wh6aq. He has a laptop that he'd like
to add a second serial port (instead of adding Tandy's internal modem).

DOES ANYONE KNOW OF A SOURCE FOR A SPECTRA STYLE CONNECTOR? IT IS AN
18 CONTACT SINGLE ROW 1 X 1/8 INCH CONNECTOR. THE FEMALE END RESIDES
ON THE BUSS OF MY TANDY 1500HD LAPTOP AS COM2 PORT. I CONTACTED TANDY
SERVICE DEPARTMENT, ONLY INFORMATION AVAILABLE WAS THAT IT IS CALLED
A SPECTRA AND IS USED ON A RIBBION CABLE! NO SOURCE OR FURTHER HELP
AVAILABLE IN OBTAINING THE SUBJECT CONNECTOR. ANY INFORMATION IS
APPRECIATED. REGARDS, KEVIN

I suspect it's one of those special ribbon cables with exposed flat conductors
at the end. According to Tandy, this port presents/accepts TTL-level RS-232
signals. Kevin's goal is to use the port for a second TNC (he already has
one TNC on the first serial port).

Please send replies to me and I will forward them. Thanks!

I have been told by a manufacturer of plug-in 9600 baud modems for
"TNC-2 clones", that the PK-88 is not a TNC-2 clone and will not work
with their board.

Can anyone provide me with a map of nodes in the UK? I enjoy trying
to set up multi-hop links to various places and such a map would be
very useful.

Thanks,
regards
/atp

>   how easy is it to keep the Mac racket in the Mac and out of the Rcvr?

Extremely easy. Macintosh computers are extremely well-sheilded. They pass
FCC standards for Class B (home-use) computing devices. Each pin on the
back of a Macintosh Classic is filtered against RFI. The inside of the case
is coated with RFI-proofing conductive coating. All cables are
shielded.

>   Are there C compilers and assemblers for the Mac?

THINK C is probably the most popular development environment for "hobbyist"
programming on the Mac. It includes an inline assembler that most find
sufficient for development.

I happen to prefer THINK Pascal, but then, that's just me.

I have a Mac SE (not unlike the Classic) in my shack and wouldn't trade
it for any DOS computer.

I forgot to comment on this one. MacPacket(tm) (note: stupid lawyers...)

was written in Aztec C several years ago. Aztec still ships a very nice C development system for the Mac. Price is around $100. I now do all of my development using Apple's MPW development system using either C, C++ or assembler. The environment is very much like the Unix development environment, only I like it better. Depending on what features you want, MPW can be pricey. The whole package is best bought as an ETO subscription for about $1K, although if you just want C, it should be much less. Lots of folks develop excellent programs using Think C, which costs in the $200 range mail order. It has a Mac application front-end (i.e. not command line), is relatively easy to use, and has some C++ like features. All three packages I mentioned have source level debugging, although you pay extra for MPW's SADE debugger.

Essentially, if you want to hack and have a good time, look at Think or Aztec. If you are going to do professional development go with MPW or Think. If it will be a large development team, MPW has features (like Projector, the project management system) that greatly ease the effort.

I hope I didn't give more info than was wanted. Essentially the answer to the question is that you can do anything with the Mac you want. Have a great time doing it!

Can someone please tell me who(m)? I should contact regarding getting myself an IP address? I live in Brookline, Mass. My ZIP code is 02146.

I'd very much appreciate it!

My current equipment consists of a PacComm MicroPower-2 TNC,
Yaesu FT-411E 2m HT, 5/8 wave antenna, and possibly a laptop soon.
Otherwise, a Genuine, Original IBM PC, not even the XT!

Yah, the REAL boat anchor! :)

One of the strongest reason to use THINK C 5.0 is that it has

a *very* good GUI-based source-level debugger.
